The past season's production of Brazil coffee has been unpre dented, and it is said that the crops for the current year up to June July, 1899, promise to be equally large and abundant, so that i not unreasonable to suppose that the two crops, reckoned togeth for 1897-98 and 1898-99 will reach the prodigious total of 20,000, bags. The bare idea of such a possibility is enough to induce caut in the rashest of speculators, and in some quarters considera doubt and uncertainty exist as to whether growers and shippers Brazil coffee, after all their gloomy experience in recent years, h seen the worst of their commercial troubles. In their circular of 26th ult., Messrs. W. H. Crossmann & Brothers, of New Yo state that "many members of the coffee trade are feeling nervous o the price, but coffee does not change base quickly. Low pri ruled from 1882 to 1886, and, following the heavy increase of pla ing in 1891, high prices existed up to 1896. It takes about f years to effect material increase or decrease in the crops. Pri below the ten cent level have ruled since January, 1897, and on basis of supply and demand we think present values are likely continue for years to come, and perhaps go lower in the immedi future."

At the moment, however, the general opinion of other autho ties is divided between "landed" parcels and "futures," one cl of holders being strongly in favour of "spot" coffee, wh another is as confident in maintaining that the article "on pap cannot go lower in price than it has done already. That there some warranty for this belief is found in the altered circumstan of the case. In two main particulars there is a pause or reversal the previous order of things. First, the European stocks (of kinds of coffee), which had been accumulating with such surprisi persistency, and which at the beginning of July and August reach about 208,000 tons, in opposition to 145,000 tons and 132,000 to respectively, in 1897, have since remained almost stationary; and is surmised that, as the receipts of coffee at the Brazil shipping po exhibit a decided falling off in comparison with those up to Septem last, the excess of stock in Europe, which has for so long been a p minent and unfavourable feature in the statistics of the berry, w from this time gradually wear away. It is likewise important to obse that there has been a material rise in prices of "futures" from lowest point in November last, when good average Santos, delivery in September-December, 1898, was placed in London at 2 to 28*s.* per cwt.; and as the latest rates are nearer 31*s.* to 33*s.* contracts running up to next autumn, it is plain that there is a d tinct recovery in the state of the coffee market from what it was 1897. Fluctuations in value may, therefore, be expected to ke within narrower limits, and, it being impossible for prices to fall the same alarming extent that they did a twelvemonth back, t trade have little need to fear the laying in of moderate stocks.

TEA COMPANIES.

Alliance Tea of Ceylon.—An interim dividend of 3 per cent. to June 30th last is payable on September 30th.

Highland Tea of Ceylon.—Interim dividend at the rate of 5 per cent. per annum for the half-year ended June 30th last.

The Pitakande Tea Company of Ceylon, Limited.—This Company has declared an interim dividend of nine per cent.

Duckwari (Ceylon) Tea Plantation Company, Limited.—The balance of profit and loss account for the year ending June 30th, 1898, after writing off ten per cent. depreciation on value of machinery and buildings, is £1,841 14*s.* 11*d.*, which the Directors propose should be applied as follows :—(1) In payment of seven per cent. dividend on preference shares, £840 ; (2) In payment of five per cent. dividend on ordinary shares, £400—£1,240; leaving £601 14*s.* 11*d.* to be carried forward to next year. The returns of crop have been 229,670lb. tea and 12,655lb. cardamoms. For next season the yield is estimated at 250,000lb. tea and 10,000lb. cardamoms. The Directors in furtherance of their policy of high cultivation have expended the sum of £471 7*s.* 10*d.* in manuring during the year. A general survey of the Company's Estates has been made, and their boundaries clearly defined, The total acreage is 1,698 acres 3 roods 27 poles, of which 921 acres 17 poles are under cultivation.

EXCHANGE AND FOOD PRICES.

AFTER writing at length about Food Prices in India, the *Madras Mail* remarks as follows :—

"In Bengal also, in the case of rice, we find on reference to the recorded prices that the large average increase in price shown for the period of 1891 to 1895 is due to a rise in particular parts of the province—in Orissa, in the Northern, the Eastern and to some extent in the Central Districts,—and may be attributed to the quickening of trade, and the progress of the general levelling of prices, rather than to any other causes. This general result seems to be evident in all provinces to a greater or less degree, and when taken in conjunction with the evidence which we have of the influence of seasonal calamities on prices, it seems doubtful whether there has been more than the very slightest general rise due to other causes. The Bombay figures, and those we quoted in a previous article for Madras, appear to support this conclusion.

"This conclusion will to many appear to be contrary to their own experience. It is, however, founded upon data in the preparation of which no pains have been spared, and which have not been prepared with a particular theory in view."

Needless to say, if this conclusion is correct, it is clear that the fall in the value of the rupee has *not* brought about an appreciation of prices of food-grain in India. A very important point for advocates of a natural currency.

RAMIE.

Do any of our readers take an interest in this fibre? If so, we shall be glad to publish any important papers concerning it that may come to hand. Meanwhile we may state that the *Kew Bulletin*, after going into the present position of the Ramie industry, sums up as follows :—

Few practical problems have consumed so much time and energy as the attempt to bring China grass and Ramie into use for manufacturing purposes. Notwithstanding all the expenditure of mechanical skill and inventive ability, the conclusion cannot be evaded that we are still as far off as ever from being able to place upon the market a finished product which will effectually compete with silk, flax, and the better qualities of cotton.

The plants can be grown with the greatest ease. But when the problem of treatment is solved, the supply of the raw material will be limited to warm countries. The cultivation of China grass in temperate regions will never be able to compete successfully with that of Ramie (or perhaps of China grass) in the tropics. It is known that when ribbons can be produced sufficiently cheaply, these can be degummed and turned into filasse at a small cost. The whole question then still turns, as in 1888, on the production of ribbons. We are still waiting for a decorticator which will not merely turn out ribbons fit for further manufacturing processes—that has been accomplished—but will turn out, say, half a ton a day at a small cost. Till this has been found, the planter cannot profitably deal with his crop, and the degumming processes, now almost entirely dependent on hand-cleaned fibre from China, are paralysed for want of a supply which will allow the finished product to compete with other fibres.

The ribbons must be susceptible of being delivered to the degumming factories at a cost not exceeding £7 to £9 per ton. This would pay the planter if he had a decorticator which would leave a profit. At present he cannot produce ribbons under £12 to £15 a ton.

Then the degumming processes should turn out filasse at a total cost of £36 to £40 per ton. At this price the demand would be considerable, and a large and prosperous industry would result. To put the position in other words, filasse must be put upon the market at about 4*d.* a lb. To use the words of one of the speakers in the discussion at the Society of Arts, "unless it could be brought down to something like the price of cotton or flax, it was impossible to make any profit out of it."

INDIA'S CURRENCY DIFFICULTIES.

A PROPOSED WAY OUT OF THEM.

THE *Pioneer* writes :—In our first article on the evidence given before the Currency Commission, published on the 2nd October, we remarked: "It is a significant result of the publication of the evidence before the Currency Commission that monometallists like Sir Frank Forbes Adam, advocates of a gold standard without a gold currency like Mr. Allan Arthur, and bimetallists represented by the Bimetallic League, are now converging towards a common ground under the influence of a perception that a compromise, which would probably take the form of an agreement to open the Mints of the three countries (France, India and the United States) at a ratio of 1 to 22 is the surest and least expensive remedy for the existing difficulties." "We are quite aware," we added, "that the Government of India have definitely declared that on no conditions shall the policy of 1893 be revoked, but this declaration is susceptible of revision, and even if it stands the weight of evidence before the Currency Commission may be against it." Our London correspondent's telegram to-day shows that the movement thus foreshadowed and described is rapidly taking a definite shape. With a strong pull, a long pull and a pull altogether, the blunder committed by the Government of India last year in rejecting the overtures of France and the United States may yet be retrieved. The particular passage in Sir Frank Forbes Adam's evidence to which reference is made is as follows: "I have already said that the proposal to arrive by gradation at open Mints has something to be said for it. I have also had it suggested to me that if it were possible to approach America, leaving England entirely out of it, and propose that they should open their Mints at a low ratio (the equivalent of 42*d.*) on condition that India should open her Mints, it would be a useful lesson, and it could not be any disadvantage to England and would benefit India. Q.—You say it would be a useful lesson? A.—Yes: We should see how America would get on with her experiment in bimetallism. I have heard that suggested several times, and if practicable, it certainly is deserving of consideration. Whether there is any practicability in it I do not know. It does not preclude what, to my mind, is the most important thing, and that is, arriving by some stage or other at the opening of the Mints for the free coinage of silver. In fact I believe it would get over many difficulties, and might be a final solution." Lord Rothschild again in one place (answer 7613) distinctly says: "I consider it a mistake on the part of the Indian Government discarding in the way in which it has done the proposals made by America and France last year." Finally, regarding the Eastern merchants to whom reference is made in our London telegram, we have excellent authority for stating that a strong current of commercial opinion in India is beginning to flow in this direction. In fact without such a compromise a large section of the mercantile community in India, represented chiefly by the planting interest—not perhaps of such imperial importance as its advocates sometimes assume, but still of very great importance—must remain permanently hostile to the Government policy.

ARTIFICIAL FECUNDATION.

The following convenient summary is from an article in the *Planter* :—

Hybridism and Colour.—The colour of stems, leaves, flowers and fruit is altered by hybridising and cross-breeding, but it is in the flower that these changes are most noticeable, since the colours are more pure and variable in the floral envelopes than elsewhere. But there is no occasion to further notice this subject in this place, although of interest, it does not directly concern us.

Modes in which Artificial Fecundation is possible.—M. Lecoq mentions the following modes in which artificial fecundation may be conducted, and a series of carefully recorded experiments carried out on different individuals of the same pure species, as follows, would be very valuable from all points of view : –

First degree.—The flower is fecundated with its own pollen—that is, pollen from the same flower in which the stigma is to be fertilised.

Second degree.—The flower is fertilised with the pollen from another flower on the same spike or inflorescence.

Third degree.—The flower is fertilised like the last, but the pollen is taken from a flower on another spike or panicle on the same plant.

Fourth degree.—The flower is fertilised by pollen from the same species, but taken from a separate individual.

Fifth degree.—The female flower is fertilised by a male flower taken from the same branch or off the same inflorescence.

Sixth degree.—The female flower is fecundated by a male flower taken from a different inflorescence borne by the same plant.

Seventh degree.—The female flower is fertilised by the pollen of a male flower of the same species, but from a different individual.

Eighth degree.—The flower hermaphrodite or unisexual is fecundated with pollen of another variety of the same species.

Ninth degree.—The flower hermaphrodite or unisexual is fertilised by pollen of a distinct species.

Tenth degree.—The flower unisexual or hermaphrodite of a hybrid is fecundated with pollen of another hybrid variety.

Eleventh degree.—The flower unisexual or hermaphrodite of a species in a pure state is fertilised with pollen from a cultural variety of the same species, or *vice versâ*.

Twelfth degree.—The flower hermaphrodite or nuisexual of a pure species is fertilised with pollen from a hybrid variety of another species or *vice versâ*.

Thirteenth degree.—The flower of a pure species is fertilised with pollen from a species belonging to an allied genus.

Fourteenth degree.—The flower of a monœcious or diœcious plant is fertilised by pollen from the hermaphrodite flowers of an allied genus or species, and *vice versâ*.

There are many ways in which new forms of plant life may be originated, or old forms modified. For the sake of convenience these may be here tabulated together as follows :—

Bigeners or *Bigeneric Hybrids.*—These plants are obtained by crossing two pure species belonging to different genera.

Bigeneric Half-breeds are plants obtainable crossing varieties of two species belonging to different genera.

Hybrids or Mules are the products of two species. The word "mule" is frequently used as synonymous for hybrid, and originated at the time when hybrid plants (like hybrid animals) were thought to be universally sterile. It being now known that but a small proportion of hybrid plants are absolutely sterile even in the first generation, the word "hybrid" should be exclusively used for the fertile progeny of two species, and the word "mule" adopted in like manner for such as are sterile.

Half-breeds or *Mongrels* are the product of two varieties of one species.

Seminal sports are varieties which not unfrequently result from seeds which have not been fertilised by foreign pollen ; indeed, seminal variation, natural selectiou, or "survival of the fittest" is nature's way of adapting plants to different localities and conditions. Many garden plants have been improved largely by carefully selecting such seminal forms as come up to our assured ideas of perfection, or the fashion of the time.

Bud sports are variations originating from a "bud, tubercle, or other organ of a single individual by division or extxnsion." De Candolle says :—"Sports must originate from certain causes as an ancestor of a different form, an actual or anterior influence of climate, etc., but the obscurity of the causes is precisely what justified the use of the word."

TEA, &c., IN CEYLON.

HERE says the *Ceylon Observer*, is the sum total of the value of the products of what is usually regarded as the "planting enterprise" of Ceylon, exported in 1897 :—

	Rs.
Tea (to U.K., Australia, Continent of Europe, America, &c.) 114,466,318 lb. valued at	46,931,190
Cinchona Bark (to U.K., Italy, France, U.S. of America, and Japan) 591,136 lb.	32,512
Cacao (to U.K., France, U. States, &c.) 35,121 cwt. ...	1,299,485
Cardamoms to U.K., India, U. States, &c.) 64 pkgs. and 551,463½ lb.	1,013,962
Total Rs. ...	49,277,149

Coffee exports alone in 1875 were valued at 45 million of rupees Low as Cinchona bark has fallen in price, its export in quantity still continues to be considerable. In 1882 the total value of the new products above given as exported was only Rs.4,529,000; but Cinchona bark alone amounting to 4,656,000 lb. was valued at Rs.3,850,000 in that year! Although the quantity in 1897 was over 590,000 lb., the value has fallen to little more than Rs.32,500 in view of the cheapening of quinine mainly through the large exports from Ceylon. The main fact to be deduced from our figures is that the plantation exports of the Colony, mainly appertaining to Europeans are still, at least, double in value those chiefly passing through native hands in the low country.

Coffee (plantation, native, Liberian, &c.) alone remains to be dealt with separately in our review of the Staple Exports for 1897 and its comparative importance only as a very minor secondary product, in our list, after the miserable export of last year, is proclaimed by the following figures :—

	Rs.
Coffee. Plantation (to U.K., Australia chiefly) 17,341 cwt., valued at	1,404,640
Coffee, Native (to India, France, Australia, Germany, &c.) 782 cwt.	48,392
Coffee Liberian (to U.K., Germany and Australia) 481 cwt. ...	19,213
Total ... 18,604 cwt. = Rs.	1,472,245
Against, Tea and other New Products, as above	49,277,149
Total ...	50,749,394

This total may be contrasted with the aggregate of the Export Trade chiefly in native hands:—Palms, oils cinnamon, tobacco, plumbago, &c., as detailed the other day:—Rs.23,252,730. In both cases, however, the values are under-rated.

It will thus be seen that the Ceylon Export Trade in tea, coffee and allied new products in 1897 was far more valuable than that appertaining to low country palms, to incnamon, tobacco, plumbago, &c. But this does not mean that we have here the ratio representing the importance respectively of these industries to the people of Ceylon. It must be remembered that a very large—if not the greater—portion of the produce of the cocoanut and other palms, as well as a great deal of the tobacco grown, is consumed in the island ; whereas all but an insignificant proportion of the tea, coffee, and cacao produced is exported. The value of the annual produce of the cocoanut palm alone in Ceylon—including arrack and toddy—is estimated to be not far short of that now attained by tea, or approximately to 40 million of rupees, with this difference, that while half of the former (produce of the coco-palm) is consumed by the three million of people locally, all but a fraction of the latter (tea) was exported from the island.

The coffee crop at the time of its maximum prosperity approached in value to 50 million of rupees, and it will be seen that 114 million lb. of tea approached that value in 1897 ; while the export in 1896 was valued at over 51 million of rupees. In 1897 coffee made only about one forty-fourth in value of the entire Export Trade in Ceylon produce, which equalled nearly 76 million rupees. How different from 1875, when out of a total Export Trade in Ceylon produce valued at 51¾ million of rupees, coffee alone contributed over 45 million of rupees!

Here again, we see how new and old products, apart from coffee, have risen in importance. In 1875 the balance apart from coffee was only 7 million of rupees. In 1897 the balance was 74½ million of which the native Exports specified, made up 23¼, and tea with other "new products" 50¾ million of rupees.

TEA NOTES FROM THE EAST.

We referred some time ago, says the *Grocer*, to the decay of the tea trade in what was once one of the chief centres of the trade in China—Amoy. The process, according to latest Consular roports, still continues. Amoy exported in 1877 over 12 million pounds of tea; in 1896 the export was less than 4½ million pounds, and last year it fell to 1,616,933 pounds, and the Consul believes that soon tea will cease to be a product of the district. There is little doubt that the extinction of the industry is due to the ruinous system of taxation. The heavily taxed Amoy black tea cannot compete with the untaxed Indian and Ceylon teas, while the dilatory and vexatious modes of collecting the *likin* lead to much of the leaf becoming damaged during transit. In the Amoy district tea gardens are to be seen which have run to waste, the comfortable homesteads of the once prosperous tea-growers being in ruins. Similarly at Canton. The tea exported from Canton is known as scented caper, and London is the only market. The export decreases every year. In 1893 it amounted to 6,000,000lb. Last year it was but 4,750,000lb. Scented capers are used solely for blending. Formerly this blending was done by numerous retailers throughout England, now it is in the hands of two or three large blenders, and should they decide to exclude scented teas from their blends, the export from Canton would entirely cease. The decrease, the Consul says, is not due to a deterioration in quality; in fact, during the past three years these teas have been rather purer, but they are being pushed out by the Indian and Ceylon growths. These latter pay no export duty, whereas the Canton duties and taxes amount to as much as 35 per cent. of the cost price. The Consul at Shanghai thinks the Chinese Government have awakened at last to the fact that the tea trade is rapidly slipping away from their country, and there are signs that it will be willing to make some concessions to encourage measures for the improvement of the tea produced. These measures will certainly not be taken too soon. In the spring of last year the United States Government passed a Bill to "shut out" spurious tea, and fixed standards of "purity, quality, and fitness for consumption" ("quality" was not in the first draft of the Bill). This was aimed at the Pingsuey production, which had become a disgrace to the trade, and it would have been beneficial if it had been carried into effect properly. It is alleged, however, that men were appointed as inspectors who were not experts in tea, and the working of the Bill became oppressive and unjust. It called forth a protest from native teamen and from the Shanghai General Chamber of Commerce. Owing to the above action of the United States Government a large stock of Pingsuey tea remained—and probably still remains—unsold in native hands. The Consul says it is unsuited for the London market. Last year's figures show that when prices rise a little above the bare cost of production there is a wonderful elasticity in Chinese supplies. But so long as the quality remains unsuitable, the demand is hardly likely to increase. The experimental use of a machine roller at Wenchow last season is said to have proved beyond doubt that the most ordinary China tea is capable of astonishing improvements if treated by modern methods. Whenchow tea made by the old native process is of the most inferior description, but, by being carefully made and machine-rolled, a very fair drinkable tea resulted. A company under the auspices of the Commissioner of Customs at Hankow, Mr. R. B. Moorhead, has been formed to experiment in this line in the Hupeh tea districts, the safety of men and machines being guaranteed by Imperial edict. A somewhat similar company is already working in Foochow, and the Consul understands it has had some measure of success, and is enlarging its operations. A feature in last year's China trade was the change of route for teas intended for the Central Asian market. Some 4,000,000 to 5,000,000 pounds of a green tea known as Hyson used formerly to go to Bombay, where it was sold to merchants trading with Bokhara, Merv, &c. This trade is now going *viâ* Batoum, and the central market will probably be Samarkand instead of Bokkhara. Also an increasing quantity of black brick tea is being shipped to North Siberia *viâ* London, where it is transhipped by Captain Wiggins' steamers. One of the largest shipments was lost, but the prices realised by teas which arrived at their destination appear to have been very satisfactory, and it is thought the trade by this route will increase. In Formosa, to prevent the adulteration of Formosa oolongs by mixture with old local leaf or China teas, foreign merchants co-operated with the Chinese Tea Guild under the auspices of the Japanese authorities. A committee, consisting of three foreign and four Chinese merchants, was appointed to deal with the questions of adulteration of tea, having the power to impose fines and confiscate adulterated teas. Formosa exports tea to the extent of some 20,000,000lb. annually, with a value varying from 590,000. to 650,000l., a figure exceeding the value of the total tea export from Japan proper in 1896. And as the Japanese endeavour to facilitate the export trade, the figures will doubtless continue to show progress.

"ELECTRIC NITRATE."

Apropos of the remarks in our leading columns, we quote below an article from the *Madras Times* on the subject of Professor Crookes' remarks concerning artificial nitrates and an anonymous farming expert's criticism thereon. If there is any planter who sides with the expert, we shall be very glad to have his views, for the subject of artificial manures is one that will bear a good deal more discussion than it has yet been subjected to by the planting communities of India. The following is the article referred to:—

A PROFESSOR CHALLENGED.

A practical scientist like Edison need fear no criticism. He theorises, to be sure, and theorises deeply; but, as soon as he has seen his way, he falls to work and tries whether his practice will fall in with his theory; and when he finds that it does, he astonishes the world with a new invention. There's no room for criticism, no room for any scientific Thomas to doubt. "Edison has invented a light that shines by electricity!"—but when he had done it he had no need to theorise about it on a platform or in a magazine; he had simply to say "come and see." "Edison has invented a talking machine!"—and Edison had no need to draw diagrams to show how it worked; he had simply to say "come and hear." "Edison has invented a machine for getting iron out of the ground by magnetism!"—and Edison had no need to have the matter discussed in the newspapers; he has simply to point to the work that his machinery is already about.

Very different, however, are the theories propounded by scientists on scientific platforms, whose theories are, at least for the time being, in the air. Our readers will remember for instance that the basis of the great theory propounded by Professor Crookes at the late meeting of the British Association of Science is literally and actually "in the air." The Professor's great theory was that an abundance of nitrogen was necessary for the rich development of the world's agriculture for the supply of the world's increasing needs; and that this abundance of nitrogen could be supplied from the store of nitrogen in the air; or, in other words, that the prime element of manure could be manufactured by a simple process in the chemist's laboratory. The possibility of getting the abundance of nitrogen has not been denied; but an agricultural expert has come forward and has confronted the Professor with the statement that the Professor knows nothing about practical agriculture, and that his theory is untrue that agriculture would be bettered by more nitrogen. The agricultural expert in question, who is the editor of an agricultural journal, says that the Professor may or may not be a good spiritualist, and may be a great chemist; but he is certainly a bad farmer, and has taken in hand a subject of which he has no practical knowledge whatever. The expert declares that the cry of "more nitrogen" would, if listened to, tend to produce "most disastrous results;" for, as a matter of fact, there is, if anything, too much nitrogen in the soil already, and that if you enter nine orchards out of ten in the United Kingdom, you will see the disastrous effects produced by the excessive use of nitrogen. The trees, he says, are forced into a rank, unmanageable growth, and the chief crops grown consists of wood and leaves. He maintains that "good culture" is the true key for the world's food; and that, with properly alternated crops, the soil would never be devitalised, and—more than this—that if farmers could decrease the supply of nitrogen furnished in foul, ammoniated stable manure, instead of increasing it, the crop would yield all the more. Finally, the expert offers to put his remarks to a practical test. The Professor and he shall each be assigned a half-acre of ordinary land adjoining each other. The Professor shall have all his appliances, and shall be compelled to use nitrogen freely; and the expert, depending on culture alone, guarantees that he will raise a much heavier crop of wheat than the Professor.

Such a competition might be interesting; but the expert has apparently been confining his ideas closely to agriculture as carried out in Great Britain. It is possible, to be sure, that the arable soil in the United Kingdom is as rich as need be; but we may note that the Professor had under consideration the development of the corn supply of the world, and not of Great Britain alone. It is easily seen that Professor Crookes was thinking not only of the well-watered and richly productive corn-fields of Great Britain, but also of the intractable corn-fields of India in which the Indian ryot, wrestling by night and by day with the unmanured soil, brings out with difficulty a scanty crop as the reward of his pains. The Professor might safely, we should fancy, accept the expert's challenge, claiming, as his right, the choice of the place where the half-acres are to be, and selecting an Indian tract for the trial. The Professor should have one half acre, and be free to put his nitrogen on the ground; the expert should have a half-acre close by, and should be kept to the part of his bargain in which he says:—"We on our part only having a spade and no nitrogen in any shape or form outside what naturally exists in the air and soil. "The expert might go in for all the good culture that he knows; but we fancy that he would come off second best; and, by the way, that after his efforts with his spade, he would be able to testify, in his next editorial, that the Indian ryot is indeed one who toils in the field.

HOW TO MAKE A TEA GARDEN PAY.

"H. C." writes to the *Pioneer* as follows:—

I am afraid "SIROCCO" in your issue of the 25th September is getting a trifle too technical for the average *Pioneer* peruser, and I hesitate to accept his gage of battle, feeling that what I write must be caviare to the general. The subject of plucking tea leaf is one nobody can hope to make fascinating, but if you will permit me I will endeavour to be brief. "SIROCCO" is on the right road to make a tea garden struggle through the present crisis. But his is not an undiscovered path. His theory of plucking is sound, but it is not novel. I began myself in 1894 the system he advocates, and I am now seriously thinking of leaving it behind, as unsuitable to the exigencies of the times. His insistence on going round the bushes once in every five days is marred by his exclusion of Sundays. Tea leaf grows on a Sunday as well as on a week day, and in consequence "SIROCCO's" plan works out into going round the garden once every $5\frac{3}{4}$ days. That is too slow for China *jat* tea, and altogether unsuitable for Assam hybrid *jat* tea. Being a heathen I always work on Sundays, and from the 1st June to 12th September this year my gangs never cease plucking a single day. During that period I went round my China *jat* area 19 times, or once every $5\frac{1}{2}$ days, and round my Assam hybrid *jat* area 28 times, or once every $3\frac{2}{3}$rd days. I exclude the period before 1st June, because drought shut us up for 13 days. On the 12th September a local holiday made it imperative to suspend plucking for five days: from the 18th to the 30th I went round the China thrice and the Assam hybrid four times. I quote these dry facts as the best practical answer to "SIROCCO's" theory. My experience of this system is that in my district, in this season (market and exchange) the China plant will not pay; and the Assam hybrid plant (plucked rather finer) will only yield a profit of about $\frac{3}{4}$ anna per pound. My plucking off China was rigidly two leaves and the bud; and off Assam hyrid about a third finer, that is half the leaf was only one leaf and the bud. The great question now is whether or not to cut the second leaf altogether, as is being done, I am informed, by one or two gardens in Assam that habitually top the market with their teas of Assam indigenous. Assam hybrid will, I believe, pay better with one leaf and the bud than with two. China I am very doubtful about. I believe the loss of crop by dropping the second leaf would not be compensated for by the increase in price. China is the rottenest stuff in the world, and I don't believe Confucius himself could make a decent beverage out of it, pluck it how he would. I do not know what district "SIROCCO" works in; but when he talks of cropping from February to December, say, ten months, I have to take a back seat, for I never get more than seven months, and last year and this my cropping season was and will be completed in $6\frac{1}{2}$ months. But since "SIROCCO" has found salvation, it would be interesting to have a few more details. He has earned the gratitude of a great many planters by putting a really sensible system before them; although I think he is wr in saying that. Prejudice is the collective experience of for days. Here I distinctly join issue with him. Prejudice is in belief just the opposite; to wit the want of experience. To bor horse racing language it is by "stupidity" out of "taken granted." But this is neither here nor there. What would be re interesting is to hear from "SIROCCO" (1) how much his tea avera in the market. (2) What is his outturn per acre. (3) What is profit per acre. Any planter can work out the other details for h self—excepting of course what the middlemen get out of tea. I lay special stress upon the profit per *acre;* it is the only t criterion. Dividends are delusive things. For instance I have, my sins, to pay a dividend on a capital of Rs.1,080 per acre. Look into the pages of *Capital* I see one favoured garden which is c capitalised at Rs.147 per acre. A dividend of $1\frac{1}{2}$ per cent. on concern would work out 10 per cent. on the concern I have my e on. Therefore let us stick to *profit per acre* and we shall kn where we are. And not to ask for more than am willing to g here are my figures:—

	Actual, 1897.	Estima 1898.
Average value tea at Calcutta ...	$6\frac{1}{2}$ as. lb.	$5\frac{1}{2}$ as.
Outturn per acre	428 lb.	410 l
Profit per acre	Rs.37-1-0	Rs.16-1

I don't call Rs.16-13-0 profit per acre "making a tea garden pa In a risky investment like tea, Rs.30 per acre at least is required gain that distinction. My estimated deficit this year as compa with last is Rs.20-4-0 per acre. I apportion and debit it as follows

	RS.	A.	P.
To the Government of India account currency policy...	10	0	0
To the Clerk of the Weather account, drought ...	3	0	0
To the middleman account excessive charges ...	7	4	0

And there you are!

QUININE IN JAVA.

WE revert to this subject in order to quote a report from United States Consul at Batavia, which certainly hold out a g deal of encouragement to Cinchona-planters in Java—*and* elsewh Mr. Everett, who is not quite accurate in saying that the act manufacture of sulphate of quinine in Java has only just beg reports as follows under date June 17th, 1898:—

Although for some years Java has been the principal country producing cinchona bark, yet the actual manufacture of sulphat quinine here has only just begun; it nevertheless, I think, deser a passing notice.

My attention was first called to the matter by an invoice be brought to me on January 18, to be certified for a shipment to United States, of 10,000 ounces of sulphate of quinine. This is first shipment on record and marks the beginning of a new, an hope, very profitable era in the trade relations between Java the United States.

Since then there have been other shipments, and up to the pres date there have been shipped, or rather invoiced for shipment, the United States 48,300 ounces of sulphate of quinine, valued $11,395.55; and I have every belief that more will follow.

There is at present only one factory for working the cinch bark in Java, and it has been running a very short time; but, spite of the drawbacks, its owners are full of energy, and the succ of the enterprise is possible.

Just now things look especially bright, as the war has resu in the rise in quinine quotations. Quinine from this factory (Bar engsche Kinine-fabrik), which in the latter part of April was at $ per unit, had risen by the middle of May to $7.54.

I think I can best describe the industry, its history and its p pects by enclosing a letter written by Mr. F. W. Sijthoff, the mana of the factory above-mentioned, who has been very courteous has offered me every facility for acquiring information. He descri matters better and more graphically than I could.

As regards the cultivation of the cinchona bark, the result of Government plantations here does not bear out the common opin that commercial ventures are better managed by private enterpr

An official report just published shows that the Government in 1896 cleared a profit of over $38,500 from its cinchona estates, while the same year was, as a rule, a very poor one for planters, owing, Mr. Sijthoff says, to the manipulations of a particularly unscrupulous European trust.

I cannot conceive of a better investment than the planting of cinchona in Java. The shortage in production in a few years will be very large, and prices will take a big jump. Concessions of land are not hard to get here if one is on the spot, and the climate of the interior of Java is as perfect as that of the coast cities is bad.

EXTRACTS FROM THE LETTER OF MR. SIJTHOFF TO MR. EVERETT.

I shall gladly give you the information requested. At first it was claimed that no quinine could be made in the tropics, and that, even in case we could make quinine, we could never sell it, because the quinine trade was entirely in the hands of the manufacturers in Europe.

The first year was for us one of adversity and disappointment; now we have not only succeeded in delivering a good product, but can sell it to advantage, the demand increasing constantly.

Our factory is now producing 90 to 100 kilograms (198 to 220 pounds) of quinine a day, which is sent to America, England, Amsterdam, Straits Settlements, Hongkong, Japan and Australia.

For a few years after cinchona plantations were laid out in Java, fabulous profits were made. Ceylon transformed all its bad coffee enterprises into cinchona plantations with the result that the production kept pace with the consumption, and prices declined. When the Ceylon plantations were seven to nine years old, it appeared that the soil and climate of that island were not good for the tree. After 1894, Ceylon was entirely exhausted, and the production fell off very sharply. A Trust that had been formed in the meantime, and that had already fixed a price for manufactured quinine, fixed also the price of cinchona bark. Thus quinine planters, although coming to the market with a moderate crop, and one not satisfying the consumption, always got inferior prices for their product.

Our factory buys no bark and carries on no trade in it, still less in quinine. We work the bark for a commission of 7 florins per kilogram ($2.81 per 2.2046 pounds) of quinine, the actual proceeds of the finished product going to the planter.

Just now the production is considerably short, so that the deficiency is made up from the stock of quinine on hand, and bark of very bad quality, which has already been lying piled up for twenty years. In another two or three years these stocks will be entirely used up, and the world will have to face a shortage of quinine.

I am firmly and sincerely convinced that now is the time to begin a new Quinine Enterprise which, with the benefit of a long experience, will be a model estate and yield in a few years great profits.

Mr. England, in the *Chemist and Druggist*, says that North America in 1897 imported in cinchona bark and quinine 10,000,000 ounces of sulphate of quinine. The rest of the world needs some also; let us say 300,000 kilograms (661,380 pounds), which makes the total 585,000 kilograms (1,289,691 pounds). The world's output is only 385,000 kilograms (788,771 pounds), of which Java produces about three-fourths.

When Africa and China are opened up, the consumption will naturally increase, especially in the latter country with its 460,000,000 inhabitants.

Java has attained its highest crop yield, and it will be some years before we can expect any satisfactory enterprise to be undertaken.

The quinine made by American houses comes from bark which is first sent from Java to Amsterdam for sale and then shipped over to the United States. We certainly could produce satisfactory raw quinine for use in America, which would make that country entirely independent of Europe. The transportation of the crude quinine would be simpler and less costly.—*Drug Reporter of New York.*

DISTRICT ASSOCIATIONS.

NELLIAMPATHY.

Proceedings of a Meeting held at Victoria Bungalow, Wednesday, September 28th, 1898.

Present.—Messrs. Barnes, Denny, Everington, Foster, C. Hall, Watts, Welchman and J. C. Abbott, *Hon. Secretary*. Mr. Watts in the Chair.

Read Proceedings of last meeting.

Quit Rents.—Read letters from the Secretary to the Dewan stating that the quit-rent on some estates had not been paid at the proper time, and requesting the Honorary Secretary to inform the planters in this district that if quit-rents were not paid with greater punctuality, the Government would be obliged to take steps to enforce due payment.

Roads.—Read letter to the Chief Engineer calling his attention to the condition of the bridge on Poothoondoo Estate, and his reply stating that this would be attended to. Mr. Hall informed the meeting that this work was now being done. Mr. Barnes reported that the road through Karapara Estate was in very bad condition, and the Honorary Secretary was requested to address the Chief Engineer about this, and ask that all the roads should be put in good condition before crop.

Hospital.—Read letter from Messrs. Burnett & Son stating that the proprietors of Poothapara Estate had kindly consented to give two acres or thereabouts as a site for the hospital building, but stipulated that the land should be properly marked out either by a ditch and bank or stone wall.

Read letter from the Chief Engineer stating that nothing had yet been decided about the hospital building.

Read letter to the Dewan from the Honorary Secretary pointing out how necessary it was that the hospital buildings should be commenced at once, as it would be difficult or impossible to get the necessary labour during the hot weather months, and that if there was any further delay, the work might have to stand over for another year.

In view of the possibility of plague being brought to this district, the Honorary Secretary was requested to write to the Medical Officer to the Government and ask him to urge on the Government the necessity for some medical provision being made at once.

Mr. Everington stated that a site for a contagious diseases shed was being prepared close to the Wallenghy Travellers' Bungalow, and it was resolved that the Association should protest against this, and ask that a more isolated position be selected.

Agricultural Chemist.—Read correspondence between the Secretary, U.P.A.S.I., and the Resident of Mysore.

WIELE'S STUDIO,

SOUTH PARADE,

BANGALORE.

The Studio, *par excellence* for High Class Artistic Photography in all its branches.

BROMIDE ENLARGEMENTS from any picture, however faded or otherwise damaged, carried out to perfection.

OIL PAINTINGS, and Crayon Drawings unsurpassed.

Out-door Photography at a moment's notice.

PHOTOGRAPHS of moving objects, such as horses in action, Ladies and Gentlemen riding their bicycles, &c., always successful.

Picture Framing in good Taste and First Class Workmanship.

VIEWS OF SOUTHERN INDIA.

Terms Moderate. Mr. E. F. H. WIELE conducts his Studio personally.

[w. 15-10-98—14-1-99.]

Bangalore Meeting.—Mr. Watts proposed a vote of thanks to Mr. Abbott for his attendance at this meeting. *Carried unanimously.*

Honorary Secretary.—Mr. Abbott was re-elected as Honorary Secretary. A vote of thanks to the Chair terminated proceedings.

CELEBRATED OILMAN'S STORES.

[w. 1-10-98—t.f.o.]

PROCEEDINGS of the Annual General Meeting of the Shevaroy Planters' Association held in the Victoria Rooms, Yercaud, on Monday, the 3rd October, 1898, at 1 P.M.

PRESENT:—Messrs. F. Short, W. J. Lechler, J. C. Large, Rev. J. M. Kempf, Messrs. W. Rahm, C. Dickins, C. Ryle, R. A. Gilby, C. Lechler (*Chairman*), Thurston Short, S. M. Hight, T. B. Nicholson, E. Dickins, C. Rahm, B. Short, Stevens, and R. Gompertz (*Honorary Secretary*).

1. Notice calling the Meeting was taken as read.

2. *Read* and confirmed Proceedings of Committee at their Meetings of 1st August, 5th September and 3rd October.

3. *Read* letter from Mr. C. Dickins, dated 22nd September, 1898, complaining that nothing had been done regarding his application for a block of waste land, dated so far back as the 23rd March, 1897.

4. *Resolved* that the matter be reported to the Collector with reference to Proceedings of the Board of Revenue, No. 1230, Mis., dated 7th May, 1898.

5. *Read* and passed accounts for the year showing a balance in hand of (Rs.469-15-11) four hundred and sixty-nine rupees, fifteen annas and eleven pies on the 30th ultimo.

6. The Honorary Secretary then read his report as follows :—

MR. CHAIRMAN AND GENTLEMEN,

With your permission I will now read my report for the past year, and will commence with the important subject of finances. Except the price of bamboo pass books, which will have to be paid to Government when the books are expended and have been returned to the Honorary Secretary, we owe nothing whatever: and, as you will see from the balance sheet, the year closes with a sum of four hundred and sixty-nine rupees, fifteen annas and eleven pies in hand. In addition to this there is (Rs.115) one hundred and fifteen rupees due to the Association for subscriptions, which will no doubt shortly be paid, so that the balance available is really Rs.584, though only Rs.470 of it are actually in hand at present. There is also a sum of Rs.30 due by Mr. Abbs; but as I can get no reply to the various letters I have sent him, I have written this off as a bad debt, and have removed his name from the books of the Association.

ii. I much regret to record that during the year we have lost one of our oldest and most respected members by death. Three have permanently left the district, and one has become incapacitated from attending to business by serious illness. Five members have thus left us, but nine others have joined; so that we have now 39 members on the rolls as against 35 at the beginning of the year. It is, I think, admitted by all that District Associations, and the United Planters' Association, Southern India (which is the outcome of them), do good and useful work; and it is greatly to be regretted that every planter does not join us. If members would but use their influence with all their friends, and point out the incongruity of a man's benefiting by the work of an Association to the expenses of which he contributes nothing, I think the anomaly would soon disappear.

iii. During the past year the system of issuing supply bills—or cheques—on the Yercaud Treasury, at a small premium, instead of cashing currency notes there, at par, has been introduced, in spite of the remonstrances of this Association, supported by the United Planters' Association, Southern India. Owing to the exertions of this Association, however, the premium has been reduced from annas four or more, as originally proposed, to two annas per 100 rupees. Taking the saving at only two annas per Rs.100 on het monthly drawings (about Rs.40,000), this makes Rs.50 per month saved, or Rs.600 per annum, through the efforts of the District Association, and the drawings are likely to increase.

iv. If Government were content to give us the option of cashing notes here at the same premium, your Committee would have been willing to accept it, rather than press their objections further. But as the Accountant-General now refuses to allow notes to be cashed here at all, either with or without a premium, and as he also refuses to grant cheques for smaller sums than (Rs.500) five hundred rupees, great and necessary inconvenience is caused by the innovation. Consequently your delegates laid the matter before the United Planters' Association at their last General Meeting, with the result that that body has submitted a Memorial to the Supreme Government praying that notes may be made cashable at every Treasury in India. A copy of this Memorial has been circulated to the Committee, and is now lying on the table.

v. The labours of the Currency Commission are not yet com-

BREECHES TRADE.

Breeches-making is a *specialité* with us. **Mr. Smith,** the proprietor, deals with every pair, and we warrant turning them out to satisfaction as regards fit, style and workmanship.

OUR SPECIAL:

MILLERAIN

KHAKI TWILL

8/8 BREECHES.

Putties 8 ft. long Rs.2.

Box Cloth Leggings Rs.9.

Newmarket Leather Leggings Rs.12.

Read this letter; it will convince you that we *can* make Breeches. **Mr. H. S. Dickins,** of Yercaud, writes: "*The Breeches received; they fit me perfect. I can, with confidence, recommend you as Breeches Makers to all my friends. We get our kit from Bombay, and have to pay about double your price.*"

[w.—15-10-98—14-1-99.]

pleted and, of course, the result cannot yet be known. But in spite of the efforts of your representative, Mr. Acworth, there is, I fear, little chance of the mints being re-opened at present. The agitation of planters on this subject has been very much misunderstood, and they have been accused of selfishly endeavouring to secure large profits for themselves at the expense of their fellow-subjects. Never was a more mischievous mistake committed, or a more groundless accusation made. The planters have not moved in the matter only as planters, but as producers, and as the mouthpiece of the mass of uneducated ryots who have well been called "the voiceless millions of India" and who are just as much interested as planters are in abolishing an inflated rupee, which is ruining the produce trade of the country. Planters—or rather producers—are by no means clamouring for enormous profits at the expense of their fellow-taxpayers. The only demand is that Government should cease to tamper with the currency and to interfere with the laws of supply and demand, which may be called the laws of nature. Producers require a natural rupee, which is at present worth about 11*d.* instead of 16*d.* At this rate the Secretary of State calculates that the loss to the Indian Government would be about fifteen crores. Producers are perfectly willing to bear *their fair share* of this loss, as stated by their representative, Mr. Acworth, before the Currency Committee. But they now lose 5*d.* on every rupee, which is equal to 31¼%. The exports are worth about 108 crores, and the loss on this at 5*d.* per rupee (or 31¼%) comes to 34¾ crores; and this crushing tax upon our exports acts as a direct bounty to those who compete with us. No wonder producers are exasperated at the timid and short-sighted policy of Government, who, to save themselves from a possible loss of 15 crores, are doing their best to strangle the export trade by making us pay a bounty to our competitors—not of 15, but of nearly 35, crores. When it is remembered that this crushing impost falls exclusively on one section of the community, viz., producers, surely it is as absurd, as it is false and mischievous to call them selfish for protesting against it.

vi. The Indian ryot is somewhat slow of comprehension; but when the fact once soaks in through the mists of his clouded intellect that he is being mulcted of 35 crores of rupees to save the Secretary of State from a possible loss of 15, the "voiceless millions" will be no longer dumb. The mints will then probably be re-opened; but not until half the producers have been ruined and the bulk of the export trade has been diverted to other countries from whom it will be impossible to recover it.

vii. I have gone into these last two matters at some length not only because they—especially the last—are of great importance to us, but also because though the efforts of the United Planters' Association, Southern India, have not as yet been crowned with success, they have at least given a widespread publicity to the opinions of the planting body, and have procured for them a patient hearing which would otherwise have been impossible.

viii. In obtaining the appointment of an influential Committee to enquire into the planters' grievances, and in many other matters, the United Planters' Association, Southern India, has done good and useful work: but it must never be forgotten that it is supported by, and owes its existence to, the District Associations, which, as I have said above, it is incumbent on every planter to join.

ix. The Committee and myself now place their resignation in your hands, and request you will be so good as to elect office-bearers for the following year.

Yercaud, } Robert Gompertz,
3rd October, 1898. } *Honorary Secretary, S. P. A.*

7. *Resolved* that the report of the Honorary Secretary be adopted, printed and circulated to all the members of the Association.

8. *Resolved* that a hearty vote of thanks be accorded to Mr. Gompertz for the ability with which he has conducted the duties of Honorary Secretary.

9. *Resolved* that the hearty thanks of the Association be accorded to Mr. Lechler for his able conduct in the chair during the past year.

10. The Chairman, Honorary Secretary and Committee having tendered their resignation, office-bearers for the coming year were balloted for with the result that the same Committee was elected as last year, viz., Mr. Lechler (*Chairman*), Mr. R. Gompertz (*Honorary Secretary*), and Messrs. Andersen, C. Rahm, C. Dickins, Kempf, F. H. Short and Large were elected Members of the Committee.

C. G. Lechler,
Chairman.
Robert Gompertz,
Honorary Secretary.

MARKET REPORT.

COFFEE.

R. J. Rouse & Co's Weekly Coffee Report (September 30, 1898) says:—

The market at Public Sales continues dull and sellers in many cases to buy in for lack of competition, but just at the close a slightly impro tone prevailed.

About 600 bags East India were offered, but only a small part sol easier prices, the rest being bought in.

The colory qualities of Columbian and New Granada met a good dem and were disposed of at fully previous rates, whilst yesterday the infe descriptions met more attention at fairly steady prices.

Futures have been firmer on unfavourable crop reports from Santos, the market advanced 6d to 9d during the first part of the week, but cl quiet 3d off the best.

Messrs. Wm. Jas. and Hy. Thompson's Report of the Colonial Markets fo Week ending September 28th, 1898, states:—

This market is very quiet, and the demand at auctions slow, ever the better kinds, which are somewhat cheaper; ordinary qualities are rather lower. Brazil markets are very quiet.

Futures have fluctuated slightly near months showing about 3d t per cwt. advance, other months being unchanged, viz.:—Good ave Santos in Havre, December delivery, fcs. 38.50, in Hamburg pf. 32, No. 7 low ordinary Rio, in New York $5.80.

Daily receipts averaged 11,700 bags in Rio, and 31,100 bags in Sant

TEA.

From the London *Commercial Record* of 30th ultimo we take the following:—

China.—Auction supplies have been very poor, but more than enough for the limited demand. Catalogues embraced 3,468 packages, only a small proportion selling at unchanged rates, viz.:—

half-chests new black leaf Congou, Oanfa 7d.
ditto Red Leaf Congou, Kaisow 4¾d.
boxes New Make Congou 4⅞d to 6d.
boxes Scented Orange Pekoe 7½d.
half-chests and cases Moyune Green, season '98-99—Gunpowder, medium to good 6d to 9¼d, fine 1s 4d; Imperial, common 3⅛d to 3⅞d, fair 5d to 5⅛d, good 8¼d; Young Hyson, ordinary to fair 4d to 5¾d, medium to good 6d to 8¼d, fine Sow Mee 1s 3d; Hyson, low and common 3d to 4d, medium 7d, Foong Mee 8d to 9d.

Indian.—Public auctions were larger, aggregating 45,900 packages, compared with 39,200 packages in the previous week, and 48,600 packages at this period of 1897. There was a fair enquiry for most descriptions, and not much change in quotations for good-liquoring parcels. Where however any falling off in quality was noticeable, competition was somewhat restricted, and lower prices had to be accepted in order to effect sales, particularly in the case of Pekoes over 7¼d per lb. Strong Broken Teas and Broken Pekoes continued to attract attention, and sold well.

For 36,400 packages on estate account 8¾d per lb. was obtained, contrasted with 9½d per lb, for 34,300 packages and 10d per lb. for 35,900 packages in the two preceding seasons.

Total printed on Importers' account in September was:—

1898.	1897	1896.
169,800 pkgs.	195,800 pkgs.	179,400 pkgs.

Ceylon.—Sales comprised 23,100 packages, *versus* 21,900 packages on the 20th inst., and 14,800 packages a year ago.

Demand was steady for nearly all kinds, but scarcely so much eagerness was displayed to purchase some of the medium to fine leafy sorts, especially those lacking strength which often passed in buyer's favour. Common grades as well as finest were well supported.

Partly on account of the smaller proportion of choice invoices the average is reduced to slightly above 8¼d per lb., against 8½d per lb. on the 22nd inst. and 8¾d per lb. at this date in 1897.

Catalogues during the month included the following:—

1898.	1897.	1896.
86,500 pkgs.	89,600 pkgs.	89,900 pkgs.
(Avge. 8¼d per lb)	(Avge. 8d per lb.)	(Avge. 8⅝d per lb.)

Java.—Only 162 packages of direct import were brought forward and passed without material alteration. Rather over 1,000 packages are advertised for the 6th prox.

The amount offered in September was:—

1898.	1897.	1896.
5,700 pkgs.	2,700 pkgs.	5,300 pkgs.
(Avge. 6¾d per lb.)	Avge. 7⅛d per lb.)	(Avge. 7¼d per lb.)

Deliveries.

The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns, were:—

From 1st to 27th Sept., 1898.....15,224,291 lb.
„ „ 1897.....18,660,819 „
(embracing a large special payment made by one Firm on the 27th September, 1897).

During the week the following have been printed for sale by public auction:—

	Sold. Pkgs.	Withdrawn. Pkgs.	Total offered. Pkgs.
India.....	39,225	6,629	45,854
Ceylon	21,524	1,578	23,102
Java	109	53	162
Total...	60,858	8,260	69,118

Also 798 packages from second hands.

Messrs. Gow, Wilson and Stanton state in their Indian, Ceylon, and Java Tea Report, dated September 30th, 1898 :—

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1898-1899...	381,219 packages.	429,875 packages.	15,644 packages.
1897-1898...	386,584 ,,	463,039 ,,	15,871 ,,

46,058 *pkgs.* INDIAN
23,960 ,, CEYLON
162 ,, JAVA
} Total 70,180 packages were offered in public auction this week.

Indian. The week's auctions comprised 46,058 packages, against 39,496. The market was steady for all descriptions, except medium grades which sold with some irregularity and occasionally at slightly lower rates. Teas of exceptional quality still continue to realise high prices.

The Official Wire gives the revised estimate of the season's crop as 154 million pounds, and the quantity available for the United Kingdon as 139 million pounds. The following table compares these figures with the revised official estimate made at the same time last year.

1897/8 Crop.	Total crop. lb.	Available for U. K. lb.
Original estimate ...	156,500,000	138,500,000
Revised estimate ...	148,000,000	130,000,000
Actual outturn ...	148,000,000	134,000,000

1898/9 Crop.	Total Crop. lb.	Available for U. K. lb.
Original estimate ...	158,750,000	140,500,000
Revised estimate ...	154,000,000	136,000,000
Actual outturn ...	...	...

It will be seen that should these figures prove correct, there will about two million pounds more available for the United Kingdom than the case last year.

In recent arrivals from Assam the good quality previously noticed barely maintained. From Darjeeling a few exceptionally fine Teas h been sold, although here again in later shipments this character was generally maintained. Dooars are about on a par with last year. Cac and Sylhet have suffered severely both in quantity and quality, owing unfavourable weather.

The average price is below last year for almost every district.

Ceylon. With a continuance of the improvement in quality rece noticeable, buyers naturally regarded the offerings with interest, stren and tone being thus afforded to the market, with good all round comp tion. No actual rise can however be quoted, and considering the qua of Tea, buyers are now obtaining excellent value for their money. A ages :—" Carolina T. C. Goatfell," 1/1 : " Hapuale Co. Kellie," " Ho wood," " Newera Eliya Co., Concordia," & " S. T. Co., St. Leonards," 1

Average 8·15d. against slightly over 8½d. same period 1897.

Java. The few Teas brought forward sold well. 1,033 packages printed for sale next week.

Bank Rate 3 per cent. Exchange on London three months sight Calcutta 1/4⅛. Colombo 1/4⅛.

IN AUSTRALIA.

The Melbourne *Leader* of Sept. 24 says :—

The *Chingtu* has arrived from Foo Chow with 300,000 lb. of new season's tea, comprising the fifth shipment. The market locally is very firm, and sales have been made privately with freedom at full rates for all lower kinds, grading up to fair flavoring Panyongs. Of Ceylon there are comparatively no stock in first hands during the week, all lines being cleared up. Dust sold at 4d, common pekoe souchongs, 5d to 6½d ; flaky fannings, 5d to 5½d ; broken leaf kinds, 6d to 6¾d ; leafy pekoes, 7½d to 7¾d ; good quality orange pekoes, 10½d to 11¾d and choice hill grown pekoes up to 1s 6d. The *Bhundara* brought 175,000 lb. of Indian. Sales held during the week were brisk, and together with private business some 2,000 packages have been sold. Rough to good quality pekoe souchongs worth 5¾d to 7½d ; leafy pekoes, 7½d to 8½d ; tippy pekoes up to 8d, and good quality orange pekoes to 11d.

PEPPER.

The London *Commercial Record* of 30th ultimo reports :—

Black.—A quiet market this week with values unchanged. Singapore on the spot has been sold at 4 1/16d to 4⅜d, Aug.-Oct. shipment at 4⅜d, Oct.-Dec. 4 3/32d to 4⅜d, and Nov.-Jan. at 4 1/16d. Sales about 200 tons.

Auction supplies on Wednesday were restricted to 40 bags Penang, which were sold at 4⅜d per lb.

White is quiet, and easier prices have been taken. Singapore on the spot has been sold at 8⅛d to 8¼d, Oct.-Dec. shipment 8⅜d to 8 7/16d ; Penang on the spot at 7½d to 7 9/16d, near at hand and Sept.-Nov. shipment at 7⅝d, Oct.-Dec. at 7 1/16d down to 7 3/32d, and Nov.-Jan. at 7¾d per lb.

At public sale on the 28th inst. only 20 bags Penang were catalog and these sold at 7⅜d per lb. for fair.

Messrs. WILSON, SMITHETT & Co. write :—" Notwithstanding a stea improving statistical position generally the market for all description Pepper remains at the moment disappointingly dull, and transactions unimportant. On the other hand, holders view the future with confide and appear content to await a revival of demand. The Havre market shown an improving tendency, although closing at some reaction ; but effect of the low prices established by the recent decline is apparent h consumers having secured supplies in that *entrepot* as shewn by the la deliveries. The crop of Tellicherry just commenced is said to be a sm one, estimated at about 3,500 tons, and if this is approximately corr little can be spared for Europe, thus further strengthening the positi

GINGER.

Cochin.—Offerings were on a liberal scale, catalogues embracing 1, bags 187 cases, but only the commoner qualities were sold in quant the bids for standard grades being generally too low for acceptance. cases 285 bags found buyers as follows :—good bold a cut 85s (which dearer), medium, some small, roughly cut and scraped 57s 6d, mou ditto 55s ; lean and dark medium and small washed rough 19s 6d, pre able ditto but mouldy 19s 6d, to 20s, ends and shrivelled brown 18s cuttings 13s, shrivelled pickings 11s 6d per cwt.

Jamaica very dull of sale, only 10 barrels being placed out of arrels offered, at 67s 6d per cwt. for dark small.

MADRAS RAILWAY COMPANY.

SURPLUS STORES FOR SALE.

The Madras Railway Company have for sale a large quantity of useful stores, machinery and plant of various descriptions, some of which are specified below :—

Augers, screw of sizes.
Blocks, irons, galvanized, of sorts and sizes.
Balances, Poley's, to weigh 400lb.
Beak, iron, large.
Belting, leather.
Bevils, sliding.
Bolts, screw, with nuts.
Brushes, platform, with handles.
Chisels, of sorts and sizes.
Chains.
Coffee mills.
Cramps for drilling rails.
Compasses, proportional, beam, and Napiers.
Diving apparatus.
Emerald green, ground in oil 28lb. kegs.
Files, of sorts and sizes.
Forges, portable, with bellows.
Glasses for semaphore, of sizes.
Glasses, crown, of sizes.
Gauges, iron, for point rails.
Handles, door, spare.
Handles, iron, for pit saws.
Hinges, brass and iron, of sizes.
Iron, angle, of sizes.
Iron, flat, of sizes.
Iron, T, of sizes.
Lamps, of sorts.
Nails, iron.
Paints and powders.
Paste, black Torbays, 28lb. kegs.
Pitch, Stockholm.
Rulers, rolling, parallel.
Screw, jacks, tripod & traversing combined with bottles, 5 tons.
Steels, spring, 1½in. by ⅜in.
Winches, crabs.
Wheels, cast iron for trucks.

A complete list of the articles, with prices and other particulars, may be obtained on application to the General Storekeeper, Madras Railway, Rayapuram, and the articles may be inspected by intending purchasers within office hours.

Volunteer Dinner at Club on 19th, and Dance at Club on 20th.

THE STRUGGLE OF COMPETITION.

Planters throughout Southern India are feeling the strain of competition with other producing centres. They are anxious regarding the future. Over-production is talked of. The currency problem has to be considered. Exhaustion of the soil is a matter that cannot be overlooked. Coffee suffers as well as Tea, though not precisely in the same way. Yet, through all the despondent thoughts that will come, the South Indian tea-planter and the South Indian coffee-planter continue to work, persistently if not very hopefully. The question naturally suggests itself, are they working in the right way? It would be absurd to suppose that this

question has not been fully considered by planters themselves. Yet glancing over recent reports of proceedings of District Associations and of the U.P.A.S.I., we find something wanting. The fact that New Markets have dropped out of the field of discussion, has been commented upon in a previous issue. Still more noticeable, however, is the entire absence of reference to the question of cost of production. Now it seems to us that the planter, as a producer of a certain commodity for sale, when he finds competition strong and prices becoming unprofitable, should consider (1) whether he can lessen the cost of production, (2) whether he can improve the quality so as to command a higher price, (3) whether he can increase the quantity without extra outlay, and (4) whether he can find some new market that will pay him better prices than he is obtaining in those wherein he has been selling formerly. In other words, there are really two main points for consideration: (1) the cost of the commodity to him; (2) the price he can get for it. In the difference between these lies his profit.

It is not our desire to more than touch upon the first point, in the hope that planters may give it earnest consideration. It is a subject that has many branches. Cost of Coffee, for instance, includes calculations of capital outlay, interest, estate charges, curing, railage, freight, &c., for the cost we allude to is not the cost on the estate, but the cost delivered in the chief markets of the world. For convenience, we may take London as representing these. Step by step the planter who wishes to meet competition, which makes itself felt by him in the form of reduced prices, must study how little capital he can do with, what are the most economical methods of raising, curing and delivering his crops. In practically every instance, the capital was fixed long ago; but the question how to supplement that capital is often only too pressing. The use of artificial manures, again, must be considered. The cost of delivering these on the estate, the cost of labour and many other points have to be studied, and we cannot but think that Coffee-planters might gain much by comparing the experiences of estate with estate, of district with district. So, too, with Tea; but in the case of Tea there is yet another matter for consideration that does not so closely touch the Coffee-planter's interests. Methods of curing are well established in the case of coffee; and neither the method nor the cost of curing is under his immediate control. With Tea the position is very different. Methods vary greatly. A little carelessness may mean a heavy loss. The establishment of small factories is necessarily expensive, yet, so far, a way has not been found whereby co-operation of many estates in one factory may bring about a reduction of expenses. It is here the chief menace to the South India Tea industry is to be found. Cottage industries in Great Britain have long dwindled away before the advance of mill industries. In India, too, the hand-loom is giving way. In the United States we find most striking examples of the small cost of goods produced on an enormous scale. In South India we shall yet learn that the estate factory cannot long hope to compete with the factory that works for groups of estates, and that the large estate has a great advantage over the small one, provided that the methods, etc., of the one are on all fours with the methods, etc., of the other. Other things being equal, the large estate should not only be able to attain a higher standard of manufacture, but to lay its product down at a lower cost than the small one; and this means that in the strain of competit small estates must in time go to the wall.

The difficulties in the way of settling this question Tea factories are very great, and it may be that So India will have to stand by her estate factories and to make up in some other way the disadvantages t incurred. At least, however, let us see the matter co dered, and discussed, and the light of personal opini thrown upon it. It seems to be years since it was touc upon. Let us see a concentration of energy bent upon solvi the problem how to reduce cost to a minimum while ma taining quality at the highest possible level. Probably ev planter can learn something from, and teach something his neighbour. Personal rivalry should be sunk in c siderations of the common welfare. The aim of one a all should be to so strengthen the position of their produ that these shall not fear the competition of any district any country. We feel convinced that methods of ma facture of tea in this part of the world are in many ca susceptible of great improvements. It is at least possi that coffee-curing might also be conducted more econo cally than it is now; and the fact that the name of curing establishment is a factor in determining the price London shows that there is room for improvement in so instances. The subjects of rail and steamer freights ha already come under consideration at odd times, and ha been talked ever at U.P.A. meetings in a desultory sort way. What we would now urge is, that a few leading m should publicly recognize the fact that cost is after all m important than London price. A decline in the latter w do the planter no harm if he can simultaneously bring abo a corresponding reduction in the former. To work for hi prices, is one way of facing competition; to work for l cost of production, is an infinitely safer one.

SIGNED CORRESPONDENCE.

As a result of consulting with friends as to the b methods of rendering this paper more attractive and m practically useful, we have received a few suggestio which are being carried out as far as possible. One gr fault that we have ourselves observed is the little we rece for insertion as regards Coffee. We are trying to reme this, but must also appeal to coffee-planters for assistan A suggestion has been made by a coffee-man that we sho start a signed section for signed correspondence only. T shall be done. We will admit to this section only lett signed by the respective writers. Further, we will n admit to any part of the paper replies to, or criticisms letters in this section, unless such replies or criticisms a also signed. Letters for insertion in the new section sho be marked "signed section." We call upon Mr. J. Hamilton, of South Mysore, the original proposer of t scheme, to open the ball, and, as a subject, commend to notice "Manures and Manuring" to be treated in th broadest and widest sense. The fact that Mr. Hamilto suggestion reached us almost immediately after t manuscript of our leading article on "The Struggle of Co petition" was completed, gave it an additional interest us, as it practically indorses our suggestion, that plant should "compare notes" much more freely than they ha hitherto done.

We take this opportunity to invite planters of T

Coffee, Cinchona or other estate products, to make further suggestions for the improvement of the paper. We would also remind them that the office of the paper is now *at Madras*, not at Coonoor.

REDUCTION OF THE BRITISH TEA DUTY.

The letters from London brokers, published elsewhere in this issue, are sufficiently contradictory to satisfy the most cynical and to puzzle the shrewdest. One holds that low teas would benefit, another that high class teas would be the gainers. Here, we find an opinion that a reduction of 2*d.* would be preferable to the entire remission of the 4*d.* duty now levied; there, it is recorded that the advantages to be derived from entire removal would be much more than double those resulting from a reduction of the present duty by one half. One party holds that an immediate stimulus would be given to demand, and that a reaction would set in later. Another states somewhat didactically that he believes in all cases of a reduction of duty "the consumer does not get any benefit for a year or so, but there can be no doubt in a few years' time we would see a much larger consumption of tea if the duty were abolished." We cannot but think that this is an erroneous view, and, in fact, that it was a mistake on the part of the Indian tea-planter to raise this question of a reduction of the British tea duty. The simple facts are, broadly speaking, that it is low-class China tea that Indian tea has to dread most. The finer sorts have become rarer, and even when available are, we fancy, little used for blending purposes. A coloury Indian blended with a cheap China leaf gives a mixture that can be sold at a minimum price, and can thus be disposed of in very large quantities. China tea at 4*d.* or 5*d.* may thus be blended with Indian at 7*d.* or 8*d.* In the one case the present duty means 100 to 80 per cent. on the value, in the other only from 57 to 50 per cent. This points to a heavy disadvantage on the part of China teas. The removal of the duty would involve the removal of this disadvantage; the reduction of the one would mean the reduction of the other. Perhaps, therefore, it might be wiser to let matters stand as they are.

SHADE.

(*From a South Mysore Correspondent.*)

With reference to your correspondent M's letter in your issue of 15th October, the *Albizzia Jeyesaman* has never been tried as shade in this province. As far as I am aware, the only other *Albizzia* besides *Molucanna* which has been used for shade is the *Odoratissima* (Kanarese *Billawar*). This is indigenous to the forests of Mysore, and though not regarded as first-class shade, being deciduous and a surface feeder, is often left Coffee is slow to come on under it, but when once established appears to thrive fairly well. Perhaps your correspondent would send a few seeds of the *Jeyesaman* to experiment with.

I notice one of the Mimoseæ sub-order, though not an *Albizzia*, is being tried for shade in British Central Africa, viz., the *Pithecolobium Saman*, or rain tree. This was introduced into India many years ago, and I believe thrives well. Being of rapid growth, it might be worth while planters experimenting with it.

NOTES.

Calcutta Tea Sales. On 18th instant 17,946 packages were sold. There was a good competition without material change in prices. The average was 5 as. 8 pies. In consequence of the holidays, the next tea sales are fixed for the 3rd November.

A "Tea" Lord Mayor. Is it any satisfaction to tea planters to learn that Sir John Voce Moore, the new Lord Mayor of London, is in the tea trade—the head of the firm of tea merchants that bears his name? He is in his seventy-third year.

Brazil Coffee. The *Rio News* of September 6 states:—There is much complaint of drought in the state of Rio de Janeiro. In many localities the food crops are a total failure. Many coffee trees have died, and others have suffered so much that they will not bear next year.

Coffee in Coorg. We learn from private advices that Coorg is not likely to do badly with its coffee this year. Crops will be on about the middle of next month. Mr. Cameron will be there in November also, to make the investigations lately referred to. Let us hope the result will be material benefit to Coorg planters.

Ceylon Tea Grants. The Governor of Ceylon has been pleased, with the advice of the Executive Council, to sanction the proposed appropriation of £1,000 sterling for advertising Ceylon Tea in Germany. A request for the bounty of 10 cents a lb. has already been put forward with respect to a shipment of 2,010lb. green tea.

The China Mission. The idea of sending Mr. Atkinson to spy out the celestial land has fallen through, and that gentleman will have to console himself with the less exalted task of twisting food and wages statistics about in fancy patterns such as deceive while charming the eye of the innocent merchant of Calcutta.

Tea Diseases in Ceylon. Taking advantage of Mr. Carruthers' presence in Ceylon, the Chairman of the Planters' Association asked him to visit and report upon diseased tea plants on an estate brought under his notice. The Committee has since approved of the Chairman's action, and authorised payment of Mr. Carruthers' fee out of Association funds.

Locusts in Ceylon. A visitation of locusts has been reported from the Kurunegale, Matale and Kadugannawa districts in Ceylon. The attention of Government has been drawn to the matter, and the Planters' Association has requested that the Director of the Royal Botanic Gardens, Peradeniya, be asked to advise as to the best treatment.

Raising the Standard! The Committee of the Planters' Association of Ceylon has resolved:—"That a circular letter be issued to all proprietors and agency houses, recommending the destruction of factory sweepings and red leaf as likely to strengthen the position

of the tea market, and reduce the sale of a class of tea calculated to injure the good name of Ceylon tea."

Willing to be helped. The following naive advertisement is from the *Times of Ceylon* :—Wanted to know—by a young steady Sinhalese man, age eighteen years, occupation Cook and Appu, if there is anybody to take me to London, as I am very willing.—Please address : James R. Silva, care of Mrs. E. Kensington, Doomba Estate, Kotmale.

Colombo Tea Sales. At the public sale of tea at Colombo on 19th instant about 9,401 pkgs. = 682,961 lb. were offered, of which about 7,008 pkgs. = 410,140 lb. were sold. The sale opened with a depressed tone, but hardened considerably later on, and closed firm for all grades. The finest teas in the sale were :—Monkswood, High Forest, St. John's, Agra Ouvah, and Glasgow, and a small invoice from New Galway. Some of the best low-country invoices were :—Arapolakande, Fernham, Polatagama, and Pallegodde.

The U. P. A. S. I. Book of Proceedings, 1898. We have to acknowledge receipt of a copy of this publication. It contains not only a full report of the proceedings of the Annual Meeting of the U. P. A. S. I. last August (including proceedings in Committee), but excerpts from and *précis* of correspondence on the currency question, the lady-bird importation scheme, etc., and reprints of the statements and evidence of Messrs. Christie, Leake, Acworth and Hodgson with respect to currency matters.

The London Tea Market. Messrs. Gow, Wilson and Stanton wired to Colombo on 20th instant that the market was steady all round, but quoted fair liquoring Ceylon Pekoe Souchong 6½*d.*, and the average price of Ceylon Tea sold on Garden account during the week 8½. The latter figure shows a drop of ¼*d.* Reuter reported the same day :—Good to fine kinds good demand at fully previous rates. Offered 25,000 packages ; sold 24,000 packages. Pekoe Souchong 5½*d.* Average 8¾*d.* (unchanged). Indian.—Average 8¼*d.* (down ⅛*d.*) Out of 49,000 packages offered, 46,000 were sold.

American Tea. If we are to be led by Dr. C. U. Shepard's "message," we must fear the competition of Uncle Sam far more than that of John Chinaman. In the matter of Tea-cultivation, as in all other matters, Uncle Sam is going to lick creation, and perhaps a general Exodus of Indian planters, to the tune of "I'm off to Charleston," would be the wisest move they could make ! Joking apart, however, Dr. Shepard's message (reprinted on another page) is interesting, and if his tea should turn out to be leaf, and nothing more—plentiful but flavourless—we shall still be grateful to him for keeping us informed of his progress.

The Yellow Terror. From Mr. Ewen Cameron's evidence in relation to the extent that the closure of the Mints has been detrimental to Indian tea in competition with China, it would appear that the copper cash has risen in price 15 per cent., and that the export duty on tea amounts to another 15 per cent., while exchange has fallen 36¼ per cent., or in other words that handicap amounts to only 6¼ per cent. But further on his evidence Sir David Barbour brings out that this exp duty on tea is an old and not a new tax, which materi alters the position and raises the handicap *since the clos of the Mints* to 21¼ per cent. according to Mr. Camero figures.

Hope abandoned. The *I. P. G.* says : "We put it the proprietors of our tea estates a other mofussilites whether it is not time that they sho utilise the bountiful jungle products we have so of directed attention to ; for despite the depletion of stock the London warehouses, it is now beyond question that will not pay alone. Another season like the one n waning will bring even the big companies to the brink bankruptcy. The cold weather in Assam may now be s to have fairly set in ; hence no time ought to be lost taking initial steps for inaugurating such industries as s lac, and the laying down of the manifold economic pla which have been recommended."

An Appeal to Russian Enterprise. Mr. Heyman Orkin, who sc time ago obtained a concession the cultivation of the cacao pl and the manufacture of cacao in the Transvaal, is n about to try to raise in St. Petersburg £100,000 for ploiting his grant of 10,000 morgen of land. The comp which Mr. Orkin is to organise will have a wide enou scope if the scheme is carried out. Its money is not to employed solely in the cultivation of cacao, but the 10,(morgen are expected to give a satisfactory account themselves in respect to the production of coffee, t cotton, caoutchouc, and other tropical productions. T prospectus is evidently to be *wide* enough !

Refuse Tea. It has been suggested that dust and all the very lowest sort tea leaf should be converted into "caffeine." Can any our readers offer an opinion as to the feasibility of giv practical effect to this suggestion in India ? Teas of lowest description are certainly not worth shipping Europe. The freight "kills" them, and they in turn h to kill prices by swelling the total quantity of offerin On the other hand, a steady one anna or so a pound for refuse tea in this country would probably not be despi by the planter, if he were only sure of getting it at all tim It would be interesting to have planters' ideas as to

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain ton :—

MANAGER, ARIENKOW ESTATE,

Shencottah

approximate percentage of total production that is merely "refuse" tea not worthy of being sold as *tea*.

The British Tea Duty. At a meeting of the Committee of the Indian Tea Association, London, held on Tuesday, the 14th inst., a special sub-committee of three members was appointed—viz., Mr. A. Bryans, Mr. C. C. McLeod, and Mr. W. H. Verner,—to meet the representatives of the Ceylon Association in London with a view to discuss the measures to be taken for obtaining a reduction in the tea duty, and to report to the General Committee. At a meeting of the Committee of the Planters' Association of Ceylon, held at Kandy on the 18th instant, correspondence with the United Planters' Association of Southern India on the subject of the reduction of the British tea duty and a letter from Mr. H. K. Rutherford were read, and it was resolved:—"That the letters received from the London brokers, and also Mr. Rutherford's to Mr. Young be published." We give them on another page.

Progress with Black Tea in America. The *American Grocer* of September 30th contains an editorial paragraph regarding Ceylon and extracts from an advertisement which a grocer who is pushing Ceylon teas in Salem, Mass. (David G. Whelton), is publishing in the local papers. The *Grocer* says:—"Down in old Salem, Mass., the people have got a taste of Ceylon and India tea. Those economical folk begin to understand that one pound of good machine-made tea will make three times the quantity of infusion that China sorts will. One of the Salem grocers talks about it as follows:—Mrs. Rorer on machine-made teas: 'They are undoubtedly more wholesome than the green-coloured teas, or those dried on copper plates.'—*Ladies' Home Journal.* Indian and Ceylon Tea is the only machine-made tea which is sold in the United States." But now the Ceylon representative has to push *green* teas also after roundly asserting that they are less wholesome than black!

The demand for Science. The Sub-Committee appointed by the Planters' Association of Ceylon to make arrangements connected with the Cacao Cryptogamist's investigations reported:—"The Sub-Committee desire, in handing in Mr. Carruthers' very able report on the Cocoa Disease, to urge on the Government the importance of the appointment of a permanent Cryptogamist, and would point to Mr. Carruthers' report, showing how much there is still to investigate in connection with parasitic fungi prevalent in Ceylon. Following this up the General Committee adopted the following resolution: That in view of the vital importance to this Colony of Agriculture, upon which its prosperity entirely depends, this Committee strongly recommends the inauguration of an Agricultural Department, and would urge on Government the appointment in the first instance of a Cryptogamist as well was an Entomologist." The attention of the Committee had, we may observe, been specially drawn to the great increase of Helopeltis on the Tea in the Udugama district.

The Sunflower. The *Produce World* says:—In a recent number we drew attention to the Potentialities of the Sunflower from a planter's point of view. Not only do the seeds of the sunflower provide an excellent food for cattle and poultry, and it stalks a fine fertilizer, but they also yield an oil which finds a ready sale. As a crop it is hardy, quickly matures, and demands but little attention. It takes far less from the soil than it adds. At Littlehampton, England, a farmer has obtained, from five hundred acres, three hundred loads, worth £10 per load, or £6 per acre. In tropical countries, even a much larger yield would be certain, while, with its quick maturity, the land could confidently be relied upon to produce either two crops of sunflowers or one crop of some other kind without becoming exhausted. Those in search of new products could do much worse than try sunflowers. European oil-cake manufacturers have begun to appreciate the seed; and we should be glad, at any time, to assist anyone going in for this to obtain a good market.

The Indian Tea Association. The American Market Fund amounts to Rs.94,614-1-6; several firms who subscribed last year have failed to make returns. The Kangra Valley Planters' Association lately decided to ask the Indian Tea Association to assist them in their efforts to obtain—(*a*) A reduction of Agents' and Brokers' commission. (*b*) Concession on steamer freights and wharfage charges. The Kangra Valley Committee were of opinion that, owing to present low prices of tea, reduction under these heads was necessary, and it was hoped that Agents and Brokers and all interested would feel that it was to their interest to assist in every way in their power in mitigating the adverse effects of the crisis through which the tea industry was now passing. The General Committee of the Indian Tea Association in the course of discussion on 3rd instant thought it would be well to point out that the Agents' and Brokers' commissions were much reduced by the fall in prices, and further that most Agents and Brokers were large shareholders in the concerns, and consequently suffered equally with other shareholders.

The Importation of Lady-birds. We take the following from the *Produce World*:—South Indian Planters have our entire sympathy in the partial failure of their attempts to import Australian Lady-birds to combat their insect pests. We hope, however, that initial failure will not discourage them from further efforts, and thus render useless the knowledge they have already gained in the art of fighting their enemies by the aid of nature. Other experimenters in the same field have met with similar checks and have afterwards succeeded, probably all the more thoroughly because of their experiences. We note there are pessimistic planters, and also scientists of standing, who fear the introduction of lady-bird beetles will prove worse as a remedy than the disease they are required to cure. Those who read our extracts from Miss Ormerod's report on "Injurious Insects and Farm Pests," published in our September issue, will have little doubt of the usefulness of the lady-bird beetle where aphis and scale exist, especially as the former insects have never been known to cause injury by feeding upon the leaves of plants. These conclusions are fully supported by Mr. Green, Honorary Entomologist to the Government of Ceylon, who believes that lady-bird beetles would be beneficial not only to coffee and tea, but to all cultivated plants in Ceylon. We hope our South Indian friends will make further efforts, and that they will succeed.

LETTERS TO THE EDITOR.

NITRATE OF SODA.

SIR,—I notice in your issue of 22nd instant a letter about nitrate of soda, in which the writer says :—"It is extensively used in growing green crops; an Engineer friend, whose brother is a Scotch farmer, told me that its intense powers of fertilizing the crop so drew the strength from the soil that when the field was laid afterwards in vetches, the part where the former crop had been treated with nitrate of potash (? soda), the crop was very poor from the exhaustive effect on the soil."

Nitrate of soda by itself is, of course, an incomplete manure, and in the case quoted, all the available phosphate and potash in the soil were used in conjunction with the nitrogen of the nitrate to produce the heavy crop. Had phosphatic and potash manures been supplied along with the nitrate, no such exhaustion of the soil would have taken place. It is only in this sense that nitrate is an exhaustive manure. Saltpetre is not so liable to produce exhaustion, as it contains potash as well as nitrogen.

It has been found at Rothamstead and other experiment stations throughout England and Scotland that nitrate of soda always gives better results in dry seasons than in wet.

COIMBATORE,

GENERAL ARTICLES.

TEA COMPANIES.

The New Dimbula Company (Limited.)—There is at least one very flourishing Tea Company. A telegram to Colombo states :—The report of the Directors of the New Dimbula Company, for the year ending June last, shows a splendid year's working. The expenditure amounts to £18,000 and the profits to £21,000. Last year's dividends are to be repeated, and £6,000 to be added to the reserve.

FINE PLUCKING.

FORECASTS of the Indian Tea Crop predict an output of about 150 million pounds. In the present state of the tea market verging upon glut, this large crop will strengthen still further the downward tendency of prices, and it may not be long before we have planters praying for small crops for every one but themselves. Big crops and low prices, however, will not have been an unmixed evil, observes the *Produce World*, if they teach planters two things—to pluck finer and to plant with other things land which has ceased to pay in tea, either through deterioration of soil, or inferiority of bushes. It is notorious both in India and London that company managers, in order to show an increased output, do not pluck so fine as they would if the estates were their own. It is easy to explain to shareholders that the low prices obtained are the result of general over-production, and to pose as hard-working men, thwarted by circumstances over which they have no control. This system, however, has two drawbacks, both of which are streng ened by continued cultivation of deteriorated soil; it intensifies glut which keeps down average prices, and also sacrifices the hig prices obtainable for better grade teas. In present circumstan therefore, the imperative course for owners of private tea-garden to put down other paying cultures on lands exhausted for tea, to go in exclusively for quality on the remainder of the esta There is nothing beats quality yet; and the tea-drinkers of world are daily becoming more fastidious in their tastes. Priv planters will thus be able to take care of themselves, and let companies go to perdition in their own way.

TRAVANCORE TEA.

MR. H. DRUMMOND DEANE, of the "Stagbrook" Estate, Peermaad, ventured upon a new departure in the direction of pushing the of Travancore Tea on the local market, his main idea being to directly at the consumer by making it possible for the purcha to buy even small quantities of the produce straight from the Est With this object in view, he has appointed Messes. Marse and of this city, his local agents for supplying packets of the leaf c taining from ½ lb. to 2 lb. each of carefully selected teas of th different grades, viz., "Orange Pekoe," "Choice Pekoe," and "Pe Souchong," all of which are securely packed and made available extremely low rates. Orders of 60lb. and upwards will be atten to directly on the Estate, but smaller weekly or monthly supp of fresh leaf can be arranged for with Messrs. Marse and Mr. Deane, as some of our readers are doubtless aware, is no no at this business, for he has had something like twenty years of plant experience in Ceylon, where he was among the first to undertake manufacture of tea with the aid of machinery, his success in t line being amply attested by the fact that he has taken several pri medals for the excellence of his output, among them being two p miere awards at the Chicago Exhibition. His manufacture has found favour with Sir Arthur Havelock, to whom he was the c purveyor during the whole time that personage held the Govern ship of Ceylon. We have been favoured with sample packets of three grades of leaf now manufactured on the "Stagbrook" Est and have no hesitation in pronouncing them the very best of th kind we have ever tasted anywhere. This opinion is shared by to whom we have submitted samples for trial. Considering largely tea is coming into use among our Native fellow-subjects all classes, and taking into account the unquestionable excelle of the samples under notice, together with the low price at wh they are offered, we are disposed to predict a big "boom" "Stagbrook" outputs in the near future. At any rate, Mr. De deserves to be congratulated on his enterprise, and on the succ it bids fair to achieve.—*Western Star.*

LABOUR FEDERATION IN CEYLON.

THE following rules have been adopted by Ceylon planters wit view to the carrying out of a scheme of Labour Federation :—

(1) That a Labour Federation be formed under the auspices the Planters' Association of Ceylon with the object of checking steady increase in the amount of so-called coast advances.

(2) That a Committee shall be appointed annually to manage affairs of the Federation, five to form a quorum, and that it sh consist of six members to be appointed by the Chamber of Comme and of such members of the Committee of the Planters' Associati as are members of the Federation. The Chairman and Secretary the Planters' Association, if members of the Federation, shall ex-officio Chrirman and Secretary of the Federation.

(3) That Meetings, either General or Committee, shall be cal from time to time by the Chairman at his discretion, or when shall be requested in writing so to do by five members of the Co mittee or seven members of the Federation, and that proxies sh be admitted at the General Meetings.

(4) That no member of this Federation shall pay more for gang taken on from another estate which belongs to the Federat than the amount of the tundu.

(5) That no member of the Federation shall take on any gang cooly from a Federated Estate without the Federation tundu o discharge note granted by a member. Members of the Federati

before engaging coolies said to come from the Coast, shall fully satisfy themselves that they are *bonâ fide* Coast coolies. In the absence of a discharge note, no "notice" canganies or coolies are to be employed, without reference to the last employer.

(6) That all tundus given by members of the Federation shall be upon the form to be supplied by the Federation.

(7) That the members of the Federation bind themselves to abide by the rules of the Federation for one year certain, and thereafter to give six months' notice of their intention to resign membership, and that a list of members be published annually and issued to members.

COFFEE HYBRIDS.

The South Sylhet correspondent of the *Planter* writes :—

I can see no reason why a disease resisting coffee plant could not be raised by means of cross-fertilisation. It has been done in the case of other products, which have been attacked by disease. Although such a plant would succumb also in time, if the raising of new varieties was systematically continued, there always would be another variety to take its place. It always appears to me surprising that no tropical nurseryman and seedsman has taken up that branch of their business. We have Suttons and Sons the noted hybridiser at home, who always are supplying the Agri-Horticultural world with new varieties to take the place of those which from some cause or other are continually going to the wall. Notably among such disease resisting new varieties being continually brought out is the potato and the grape vine. Sometimes after such a variety is brought out which has every appearance of fulfilling its mission as it were; it developes one particular objectional point which completely nullifies all the other good points. In such a case it sometimes is put right by crossing the variety with one which happens to be particularly strong in the other's weak point. As I said above it is surprising that no tropical nurseryman has taken up this branch because to be of permanent utility it must be continuous. My garden being completely isolated I purpose going in strongly for cross-fertilisation, and shall closely follow the proceedings as they go on in Southern India. I would very much like to secure some seed of stenophylla. This Sierra Leone variety is one of the two indigenous West African species which in point of commercial value (according to Kew authorities) may prove a formidable rival of the Arabian coffee. It was regarded by Bentham in the "Niger flora" as a variety C. Arabica. The plant is described as an ever-green shrub or small tree up to 20 feet high. The youngest leaf shoots are pink. Leaves four to six inches long by 1 to 2½ broad, bright green and glossy above, paler beneath, flowers large white, 1 to 1½ inches across the corolla lobes, berry ½ an inch in diameter, globose seeds, hemisphere with a narrow ventral furrow. It grows very freely and yields quite as much as Liberian, but is somewhat longer in coming into bearing. It is of superior flavour to Liberian, and it is reported that Frencha deader has lately been selling it as best Mocha. It can be grown from 500 to 2,000 feet elevation. "Plants" raised from seed flowered at Kew in September 1895 in one of the tropical houses. It is said not to have thriven as well as could be wished at Dominica and Ceylon, but has done well at Trinidad and Jamaica as well as the Straits Settlements. I would think that such a variety as stenophyla crossed Maragogipe might give us something far superior to anything in cultivation.

LIBERIAN COFFEE IN SUMATRA.

Liberian Coffee appears to be doing well in the Upper Serdang District on the East Coast of Sumatra. The Manager of Begerpang wrote on August, 1898: "That Begerpang *will be* the largest estate of Serdang is the verity, because I will have 400,000 trees till the end of the year, and plant 100,000 more during the next year.

"I would like to see in another article the cost price of one picul of coffee sold in Europe. I think that this price will not be more than fl 20 (guilders) a picul (including 5 per cent. rent of capital) on a fully bearing estate where the youngest trees are not less than three years' old. The price now in this bad season paid in Europe are fl 36 to fl 38 (guilders) a picul. B B estate sold lately 62 to 65 centimes per 500 gr. in Havre. This will be fl 38·75 to fl 40·62 per picul. So we can always reckon that we will get an average of fl 35 to fl 37 over a long period."

Almost at the same time a Ceylon Planter wrote concerning Liberian :—"The prices are too very bad! Here it sells at R20 per cwt. or R3·87 per bushel parchment."

Another estate in Sumatra has never netted during all this time of depression, less than $29 per picul.

The battle of the distances rages there. Regarding it, the Begerpang Manager writes: "I have myself adopted the distance of 10 ft. by 10 feet, and think that this will be the best. 12 feet by 12 feet would be very nice, but regarding the wealthy growth of our weeds, I would not be brave to use this distance. Less than 10 feet by 10 feet is certainly not enough. The soil in the lalang (illook) is quite the same as in the forest. Altitude 300—600 feet. Rainfall all right. Returns of 10 to 12 cwt. per acre after four years (two katties per tree) all right."

Another man says 12 by 12 feet. Yet another 12 by 12 feet with a quincunx, and again 14 by 14 feet with a quincunx. On his way to Ceylon, Dr. Treub, of Buitenzorg, had a glance at the district Unfortunately he had no time to go through it; but he is reported to have said that, taking into consideration soil and climate, 15 by 15 feet was the distance for Liberian coffee in Serdang. And yet another combatant slips in, declaring for 7 feet, and says :—"Take off two crops, and thin out till you are 7 by 14 feet. Afterwards thin out as occasion calls, until you are 14 by 14 feet. Some friends adopted my views, and are now growing in spirit. They confess that the returns are grand, more than could have been anticipated. But what cuts them to the heart is the prospect of having to cut out such magnificent coffee."

This planter says further:—"When I first knew Serdang three and-a-half years, ago, there were four coffee estates, all in the initial stage, aggregating about 600 acres. There are now twenty-three estates (possibly more) with fully 8,000 acres planted in coffee, and extension is still the word. Two or three estates there are that began with small capital when coffee was $40 upwards at Singapore, looking forward to easy borrowing times later on: and of course depression put these into a quandary for a time. But every one of them has struggled through the rapids."

ADULTERATED PEPPER.

The pending prosecutions naturally direct attention to the chemical constitution of Pepper, a subject in one way well known, but in another hardly examined as yet. The active properties of the spice depend upon the presence of an acrid resin, a volatile oil, and a crystallisable substance called piperine or piperin. The latter is said to have no colour, or smell, and to consist of piperic acid and a liquid colourless alkaloid known as piperidin, which boils at 106°C and then smells of Pepper and ammonia. The resin is very acrid, and the oil has the smell and taste of Pepper. The physical structure of

the corn is extremely complicated, and its cellular composition seems to have been carefully studied under the microscope. With all this detailed knowledge it appears to be wanting in practical application, What is wanted from scientific men is a guide to what constitutes the intrinsic value of Pepper. Is it the resin, the oil, or the piperin; or must all three be taken together, and, if so, in what proportions? Again, a very important practical question is, whether the various valuable constituents are equally diffused perpendiculalry through the whole of the corns, or whether they are to be found separately, in the various horizontal coloured layers, from the black rind to the innermost white centre. The local arrangement of the constituents is of great and increasing importance, from the immense amount of decortication and sifting that now goes on in the search, not for the best or most pungent, but for the whitest Pepper. It is certainly the distinct impression of those best acquainted with the trade that the whiter the Pepper the worse it is as a spice. Of course, if the public prefer a nearly flavourless white flour to a pungent dark Pepper, they get what they ask for, especially as these white powders, when honestly produced, are extremely expensive, and fetch a high and consequently relatively profitable price. But given a taste for white flavourless Pepper, it can be dishonestly or fraudulently satisfied without going to any great expense. The adulterator for years has found ground Rice a cheap and harmless commodity to vamp off as Pepper, but that is a substance which the analyst can readliy enough detect. The refuse shavings in making buttons from white bone or earth nuts would certainly not have been a substance which the ordinary mind would have selected for adulterating Pepper, but finely ground up it appears to yield an opening for the fraud on a large scale. Sam Weller's story of the sausage maker who mysteriously disappeared, and whose sad end was only traced after a lapse of time through the widow coming across one of the deceased's trouser buttons in her sausage, however, suggests an analagous test. It appears that the analyst can detect the button refuse in Pepper by incineration, because the ash is so suggestively large. There is a mysterious demand for empty walnut shells, in some quarters supposed to be devoted to spice grinding. Whether they turn into Pepper or into Nutmegs, or Mace, Cassia, Cinnamon, or what not, would be an interesting subject for inquiry. One would not think that Pepper at its present prices would so largely invite apt adulteration's artful aid. In the old times, when a peppercorn rent meant something tangible, it was different. Alaric the Goth, in A.D. 408, imposed a fine of 3,000lb. of Pepper as part of the ransom of the city of Rome. The Portuguese were led to discover and sail past the Cape of Good Hope in their search for cheaper Pepper. If Henry the Navigator and other great sailors had lived in these days of poivrette, button refuse, and ground rice, they would only have had to visit certain English spice mills, and the problem would have been solved, while the South African question would not be with us.—*The Produce Markets' Review.*

NOTES FROM *THE PLANTER.*

IT may not be generally known to planters, but it has been proved by repeated experiments that straw saturated with a solution of lime or common whitewash is incombustible. The fact is of great importance, especially as thatch is not only rendered fireproof, but more durable. A solution of alum has been tried, but, being soluble, the rain destroys its virtues.

Any of our readers who wish to send home, or preserve, impressions of tea or other leaves, will find the following the best method to adopt. Cover a sheet of white paper with a thin coating of grease, and then smoke it on the same side, over a smoky flame of an oil lamp. Lay the leaf on the sheet, so prepared, and fold the sheet, so that the smoked paper will press the leaf on both sides. Then remove the leaf, lay it on a clean sheet of paper, fold the paper over it, and press it heavily between the leaves of a book. When the leaf is removed, the impression on both sides of the paper will appear like a finished pencil drawing, if the process is carefully done.

It is said that timber posts can be made to last for a very great number of years by using the following recipe: Take boiled linseed oil, and stir in pulverised coal to the consistency of paint. coat of this over the timber, and the post will last as long a in the ground.

Dr. Hartig, who has made numerous experiments to dete the point, states that March and April are the best mont which to cut timber for building purposes, as it then contai lowest percentage of moisture, which he states to be forty- per cent. During the three previous months it has fifty-or cent., and the three following ones forty-eight. He further that properly seasoned timber should not contain more than twenty to twenty-five per cent. of moisture, and never less ten per cent. If the moisture is removed to a still greater e the wood loses strength and becomes brittle. Another auth states that if trees are felled as soon as they are in full lea allowed to remain undisturbed until the leaves dry up and fa the timber will be found well seasoned, the leaves having exha all the moisture. It is not stated where the doctor carried ou experiments, but the results given are instructive.

If trees are cut at any time after the trees are fully developed in most active growth, the branches and leaves being left on ti leaves completely wither, and the bark removed from the body tree, the best results will be secured for lasting timber. This European plan. The leaves draw out much of the sap, which con the most fermentable substance in wood, and that which furn food for worms, which prey on wood. By cutting off the bra and leaves as soon as the tree is cut down, the pumps are sto which would nearly pump the tree dry. In removing the ba expose to air and rain that portion of the wood richest in albumi and putrescible material, and which serves as the breeding of destructive worms. If this is washed and dried by natural cies, the quality of the timber will be much improved.

That there is a right season for felling timber, and that the of timber for building purposes largely depends on this season chosen, are generally admitted facts; yet the practice of diff peoples and districts is found to vary most essentially. Thus ac ing to a German writer, while the time for cutting timber for b ing is legally fixed in Germany in the months November to Jar in the Alpine districts of Switzerland and Austria, the best and durable timber for building is considered to be that which is f in the summer. The reason of this is that the wood of conif trees, fir, pine, &c., contains least moisture in May and June, a the felled timber is left on the ground till the following wint becomes well dried before it is taken away. However this ma with the coniferous trees of the mountainous districts, it is ce that the trees in the plains require different treatment.

The question has been subjected to a series of tests in Ger m and the result is sufficiently conclusive. In one case the experi was with four beams of equal length, breadth and thickness, and shaped in the same fashion, cut from trees of the same growing close to one another, and kept on the same dry spot only difference between them being that they were cut in different months. The timber felled in December was the stron of all; that cut in January was twelve per cent. inferior to point of strength, or power of bearing pressure; that cut in Fe ary was twenty per cent. and that cut in March thirty-eigh cent. weaker than the December timber. In another experi entire pine-trees were buried in a moist, damp soil; one sort been felled in December, the other in February. It was found the latter had turned rotten in eight years, while the former sixteen years before it decayed. A similar experiment with planks showed that those sawn from trees felled in March dec in two years, while planks from December timber lasted six yea

A planter correspondent writes:—"What is to be the outcon sixpenny tea; for this is what Sylhet and Cachar are at season? Does anyone know? Has anyone considered? Has an ever thought that this may last for a year or two? It is all very saying, "Oh, yes; this year I am bound to make a loss;" but if this goes on for three or four years? How many proprietors

MILLIE & REDMOND, late P. THOMPSON & CO., *Ootacamund, Engineers and Contractors.*

fork out? Another thing is, even if European proprietors won't go on, the garden will be put up for sale and bought for an old song by natives, and the places will go on yielding, and making bad tea—"muck," one might say,—do harm to the district, and prices will remain at the same level. We heard rather a novel idea suggested that—to remedy this, the amount subscribed to the American Fund should be diverted to buying up gardens such as we have referred to above and allowing them to revert into jungle, and thus reduce the outturn for a year or two; and there is sense in it, we think. But we will no doubt hear in our columns from our numerous correspondents what their views are. In a multitude of councils there is wisdom.

A great deal of excitement has been caused by "Sirocco's" utterance in the *Pioneer* re a new style of plucking to be introduced, to give a finer quality of liquor with a slightly reduced outturn. Some seem to think it would ruin the bushes, others are half-inclined to try it, and so on. It may be stale news to some, but it is well known that this system was tried in Cachar for several years, and then introduced into Sylhet; returned to Cachar following the vagaries of its initiator, but it never took on, and we believe the inventor, or whatever you like to call this enterprising planter, is just now in retirement. It is astonishing, however, jesting apart, how little the outturn fell short the first season; in fact for a time it was in advance of previous years. But the second and third year's expectations were anything but what were looked for, and we beleive the gardens so treated have now reverted to the former *dustur*, old-fashioned though it may be.

We were rather astonished to see in a contemporary, in one of the effusions signed "H. C.", that he puts down the profit of a tea garden in Sylhet or Cachar at a $5\frac{1}{2}$ anna average, at Rs.16 per acre, with a five maund outturn. Don't every planter in those districts wish he might get it! Five maunds per acre outturn, at Rs.27-8, reads a gross of Rs.137-8. The average local expenditure on a Sylhet or Cachar garden is about Rs.110 per acre. This leaves Rs.27-8 for brokerage, Calcutta charges, etc.; or, deducting the supposed profit of Rs.16, a balance of Rs.11-8 is left for these. Take a garden making, say, 3,000 maunds of tea, *i.e.*, 600 acres at five maunds, the Calcutta expenditure would only be Rs.6,900. Has anyone of our readers a share in such a garden? If so, he might give us an idea how this compares with actuals; our own experience is that it is barely half.

PRODUCE AND PLANTING.

Tea and Tea Drinking.

A series of trade exhibitions are held annually at the Agricultural Hall, and the grocers have held theirs this week. Dr. Goodfellow, who devotes his attention mainly to food products, and frequently lectures at these exhibitions, discoursed to the grocers about tea. From the grower's point of view he had nothing new to say. There were the usual platitudes about tea and tannin, and the evils of strong tea. He pointed out in praise of tea that the physiological effects of drinking properly prepared tea in moderation were those of stimulating the nervous system, increasing the circulation and activity of the sweat glands, but theine acted as a general rouser to the brain and higher nervous centres. The increased circulation produced perspiration, so that it was scientifically true to say that a cup of tea cooled, the increased flow of perspiration leading to loss of heat from the body. When tea was properly prepared, and not taken in excess, it was practically non-injurious, and was a necessity in order to meet the conditions of modern life. Badly-prepared tea contained an excess of tannic acid, and that body acted most injuriously upon the digestive system. Many attacks of indigestion were brought on by drinking so-called "strong" tea at meal times. Tea-drinking, when carried to excess, might also produce in those who were predisposed to nervous complaints palpitation of the heart, hyper-excitability, sleeplessness, and nervousness; and those who were naturally of an excitable nature and suffered from nervous complaints should be careful not to carry tea-drinking too far. The golden rules he laid down with regard to tea-drinking were: always to use good tea; use water which had just got to the boil; infuse about four minutes; do not allow the leaves to stand in the infusion; avoid second brews and the used tea leaves; avoid tea at the principal meal; and, if suffering from heart or nervous complaints, only use the very finest qualities of tea, with short infusion.

Really?

A writer in the *Standard*, in commenting on this lecture, thinks he can go one better than Dr. Goodfellow. He not only rails against tea-drinking generally, but he gives some advice gratis about the evils, as he calls it, of the excessive use of Indian and Ceylon tea in particular. He says, oracularly: "It is no exaggeration to say that tea-drinking at the present time is a great national vice. Our consumption goes up year after year, rapidly and without faltering. It does not follow the state of trade, like strong drink. Whatever else people do without they buy more and more tea. We indulge in it far in excess of all the world except China and some of our own colonies; but they both consume a very different kind of tea. The increasing consumption in this country has been accompanied by a change from Chinese to Indian and Ceylon teas. The former, which represented nine-tenths of our consumption only a few years ago, has now sunk to an insignificant fraction. This is a splendid thing for India and Ceylon—such a splendid thing that everyone is loth to say a word against it. But the truth is that excessive use of these teas is a very great evil. They have made their way, and ousted the China leaf, mainly because they are cheap and 'strong,' otherwise black. The average Englishman reckons his tea by the blackness, and the average housewife buys the kind with which she can make most cups of the standard shade, so to speak, out of a pound. Indian tea, and in a less degree Ceylon, will make half as many cups again of sufficient colour and 'twang' as China. It represents, therefore, a very substantial economy to the thrifty housekeeper; but the blackness and the strength are not desirable qualities from the dietetic point of view." Of course this exordium winds up by the advice to the working classes that rather than drink strong, black tea, they had better drink beer.

Last Week's Tea Sales.

The quantity of Indian tea catalogued for public sales amounted to 45,753 packages, and of these 39,700 were sold on the days of sale. The principal feature of the market, says the *Produce Markets Review*, referring to last week's sales, has been the firmness of the common descriptions, and although no actual advance can be recorded, holders show less disposition to accept former rates. This is no doubt due to the comparatively small stock of similar grades of other growths, and it is quite probable that the firmer tendency of prices may be maintained. On the other hand, any advance of importance at this period of the season would have a detrimental effect on the demand, and it must not be forgotten that the proportion of these sorts is considerable. Although common teas are firm, the medium kinds sold at irregular rates, occasionally in the buyers' favour, but this has been due in a great measure to the poorer quality of many of the teas offered. The better descriptions have, with few exceptions, also shown a declining tendency, the less desirable character of the teas being responsible in a great measure for the depreciation in values. Taking the teas generally, especially those from the Assam and Darjeeling districts, the depreciation in quality is very marked, and it is quite probable that the future imports from these gardens, although they may show an improvement later, are hardly likely to be up to the average of the earlier pluckings. The demand for Ceylon teas continues active in this market, and, with a strong feeling and with only moderate supplies, a further advance in prices may be expected. The lower grades are still much in demand, but no alteration in their value has taken place, very little being obtainable under $5\frac{1}{4}d.$ per lb. Medium descriptions have been in good demand, and higher rates were in some cases paid, both Pekoes and Broken Pekoes being well sought after. The quality generally has again been good, and the finest grades continue in request, while full prices have been obtained for all teas worth more than 1*s*. At the public sales 23,900 packages were brought forward, of which about 1,400 were withdrawn.

Information Necessary.

The Indian Tea Association should issue tracts about Indian Tea. They are needed. A correspondent sends us some particulars which throw light on the fancies indulged in by some ladies with regard to Indian tea. Our correspondent came across the report of a meeting of the National Union of Women Workers held in London some months ago, at which the president of that body, Mrs. Alfred Booth, delivered the following denunciation of India tea: "Now," said the lady, addressing an assembly of school teachers, "for the one or two articles of diet which teachers ought to bear in mind. The first is *Tea*. When I first came to England it was said that you could

always get a good cup of tea, but I am very much afraid that now we shall have to drop that, for it is very seldom that you can get a good cup of tea. We all drink Indian tea because it is a new industry introduced into this mighty Empire, but may I call your attention to Indian tea and ask you to study it from a scientific point of view, and find out how much more tannin there is in it than in China tea? You are, as reformers, in duty bound to consider this subject, and the effect upon the constitution of drinking Inian tea which has stood more than one or two minutes in hot water. A lady who has lived in China tells me the reason Indian tea is so much ranker than China tea; it is because it is grown in virgin soil, and in fifty years Indian tea will become delicate like China tea. We generally think virgin soil is the most delightful soil for anything to grow in, but until it becomes seasoned—fifty or sixty years hence—will you ladies please be careful when you are giving your lessons on drinks to dwell particularly on the tannin in Indian tea, and its deleterious effects on the constitution?" The tea-growers of China should be deeply obliged to Mrs. Booth, and the Indian Tea District Associations might with advantage send the lady a few facts in connection with Indian tea which would, unless she be hopelessly prejudiced, induce her to modify her opinion, and encourage the spread of sound knowledge. If the school teachers thus addressed have been carefully echoing her views, the tannin bogey will be very much to the fore again before long.—*Home and Colonial Mail.*

REDUCTION OF THE BRITISH TEA DUTY.

THE OPINIONS OF THE LONDON TEA BROKERS.

The following are copies of letters addressed to Mr. E. J. Young from London brokers and from Mr. H. K. Rutherford, which Mr. Young recently submitted to the Committee of the Planters' Association of Ceylon, with reference to the subject of reduction of the British Tea Duty:—

MR. YOUNG'S CIRCULAR LETTER.

Messrs....., Mincing Lane, London, E.C.

Dear Sirs,—A movement is on foot in Ceylon to memorialize the Chancellor of the Exchequer for the abolition of the Duty on Tea. Might I ask you to be good enough to give me your opinion as to the probable effect on the consumption of Ceylon Tea, if total abolition (4*d.*) or a moiety of the duty (2*d.*) be removed, and whether in your opinion the import of the China product would be increased thereby. With your permission, I intend to make use of your opinion before the Planters' Association of Ceylon.—I am, yours faithfully, (Signed) Edward J. Young.

Colombo, 12th July, 1898.

MESSRS. WILSON, SMITHETT AND CO.'S VIEWS.

Edward S. Young, Esq., c/o Messrs. Whittall & Co., Colombo, Ceylon.

Dear Sir,—We are in receipt of your letter of the 12th July, and in reply to your questions, we are of opinion that the Home Consumption of Ceylon tea would, in all probability, receive some stimulus, in common with that of other growths, from a reduction or total abolition of the duty; any alteration would, we think, affect every growth alike, with this exception, that inasmuch as the present fixed duty imposes a relatively heavier tax on low priced tea, any reduction or total abolition of duty would give considerable impetus to the exportation of common tea from China, which would, in that case, become once more an important factor in the trade, and interfere considerably with Ceylon and Indian tea in the market for low grade tea for "price." The total abolition of the duty and the consequent absence of proper Customs supervision would also greatly facilitate the importation of worthless or adulterated leaf, which has hitherto not been allowed to be entered for Home Consumption.

You are quite at liberty to use these remarks before the Planters' Association of Ceylon, and trusting that you will find them useful, —We are, yours faithfully, (Signed) Wilson, Smithett & Co.

41, Mincing Lane, London, E.C., Aug. 5th, 1898.

MESSRS. W. J. AND H. THOMPSON'S OPINION THAT THE BEST TEAS WOULD BENEFIT.

E. J. Young, Esq.

Dear Sir,—In reply to your letter of July 12th, we write to say that opinion differs very widely among those who are interested in the question as to the probable result of an abolition or reduction in the duty on tea.

If the tax were removed, we think probably the number of di butors might be increased, with the result that for the time at l demand would be brisk and clearances large, which would dep stocks to the benefit of importers—but it is by no means certain a large permanent increase in consumption would follow—seeing cheap tea, as a beverage, now is.

Some think the remission of the duty would render it more eas admit unsound and spurious tea. We think, on the contrary, vigilance of the Inspectors would not be lessened, and if it we stimulus could quickly be applied.

Looking at the question broadly, we incline to the opinion generally held) that abolition of duty would turn the scale in fa of the *best* as against the *cheapest* tea—thus directly encourage production of the finer kinds in Ceylon—but importers would expect to obtain more than a part of the total remission, and only for a time.— We are, Dear Sir, yours faithfully, (Signed) Jas. & Hy. Thompson.

38, Mincing Lane, E.C., London, August 8th, 1898.

MESSRS. WALKER, LAMBE AND CO. BID FOR TOTAL ABOLITION.

E. J. Young, Esq., Ceylon.

Dear Sir,—We beg to acknowledge receipt of your favour of ultimo.

In considering the points on which you ask our opinion, we th it well to record our figures of home consumption. Taking th from the Board of Trade returns, they read as follows:—

YEAR ENDING 31ST DECEMBER.

Home Consumption.	1895. lb.	1896. lb.	1897. lb.
Tea from India ...	116,343,314	122,941,096	124,534,194
Do. Ceylon ...	74,023,809	80,294,475	85,493,554
Do. China ...	26,201,374	19,831,678	17,242,247
Other countries ...	5,231,640	4,718,251	4,129,783
	221,800,137	227,785,500	231,399,778

Again taking figures just published and showing results for seven months of this year:—

SEVEN MONTHS ENDING 31ST JULY.

Home Consumption.	1896. lb.	1897. lb.	1898. lb.
Tea from India ...	70,162,579	71,852,593	76,127,862
Do. Ceylon ...	44,883,290	48,223,876	48,079,216
Do. China ...	11,228,204	10,452,219	8,688,588
Other countries ...	2,751,194	2,126,748	2,764,789
	129,025,267	132,655,436	135,660,455

We are of opinion that a decided stimulus would be given to consumption in this kingdom of Ceylon tea, if the present duty w reduced by 2*d.* per pound; but inasmuch as the conditions un which teas must be entered and warehoused, and handled for mere purpose of securing and collecting the duty, are necessa cumbersome and expensive, the value of such a concession would *much more than doubled* by a *total abolition* of the present duty of

We see no reason to suppose that China tea would be specially nefited by such changes in our duty, but assuming that the percent of increase in its consumption to be equal that of Ceylon tea, s increase would be about one-sixth of the Ceylon increase. We of opinion that such fiscal changes would still leave the gen position untouched, this general position being as shown in above figures that our use of Ceylon tea is increasing—our use China tea is decreasing.—We are, Dear Sir, yours faithfu (Signed) Walker, Lambe & Co.

23, Rood Lane, London, E.C., Aug. 12th, 1898.

MESSRS. SANDERSON AND CO. COLLECT OPINIONS.

E. J. Young, Esq., c/o Messrs. Whittall & Co., Colombo.

Dear Sir,—In reply to your letter of 12th July, asking us to g you an opinion as to the probable effect on the consumption Ceylon tea if the duty were abolished or a moiety thereof remo we have now the pleasure to inform you that we have discus these questions with several dealers and brokers in the Lane, find they are generally against the total abolition of the duty, would not object to a further reduction. If the Chancellor entir removed the duty, all checks on the movements of the article entir disappear, consequently no reliable figures could be obtain Doubtless the consumption of all classes of tea (not only Cey

would be increased, but we fear it might encourage the importation of the commoner productions from Java, South Africa, and other countries, where they are beginning to cultivate tea, and would most likely also induce growers to send us inferior qualities to a greater extent than they do at present.—We are, Dear Sir, yours faithfully, (Signed) Sanderson & Co.

37, Mincing Lane, London, E.C., 18th Aug., 1898.

MR. GOW TO WRITE LATER.

E. Young, Esq., Colombo.

Dear Sir,—We are in receipt of your favour of the 12th ult., addressed to our Mr. Gow, asking his opinion as to the probable effect on the consumption of Ceylon tea if the duty is abolished; also as to the effect of the duty being reduced 2*d*. Mr. Gow is now away on his holidays, but we shall have much pleasure in placing your letter before him on his return, when he will doubtless address you fully on the subject. We are, &c., (Signed) Gow, Wilson & Stanton.

13, Rood Lane, London, E.C., Aug. 12th, 1898.

MR. RUTHERFORD'S COMMENTS—THE STIMULUS GIVEN BY LOWERING THE DUTY.

My dear Young,—I had yours of 12th ult., and would have answered it earlier, but many things intervened to prevent me. I am afraid my opinions on this question of the abolition or reduction of the tea duty are of no more value than those possessed by the men around you.

We have not been able to get the Indian Association Committee to arrange a joint meeting to discuss the subject. They had a discussion on the question about a year ago, and as opinions vary very much as to the desirability of pressing it on the Government, they came to the conclusion to do nothing.

Opinions differ among the members of the Ceylon Association in London as to the advisability of having the duty either lowered or abolished; and I scarcely think, unless there is a considerable majority among the Planters in favour of taking action, it would be politic to ask Government to move in the matter.

I believe in all cases of a reduction of duty the consumer does not get any benefit for a year or so, but there can be no doubt in a few years' time we would see a much larger consumption of tea if the duty were abolished. The people perhaps would not actually drink much more than they do, but there would be more waste.

The annual increase of the population of England is 300,000, so that the natural increase of tea consumption would be only say 1,500,000 lb. (5 lb. per head); but since the duty was lowered the average annual increase has been 5,300,000 lb. so that we may claim an increase of 3,800,000 lb. per annum due to the reduction of duty.—Yours truly, (Signed) H. K. Rutherford.

Bude, N. Cornwall, 27th Aug., 1898 (Polmont, Kenley, Surrey).

DOES MANURING PAY?

Replying to the above question, "F. S. E." writes from Maskeliya to a Colombo contemporary:—

I am going to try to convince you that manuring does not pay, at present prices. With your permission, I will state a hypothetical case,—and when I say hypothetical, I mean that I have no books to show, but my figures have been obtained from men who are actually manuring, and who believe that it pays.

Let me assume that I have been superintendent of an estate for a number of years. The elevation is medium; the cultivated area is 400 acres; the yield 450lb. per acre; the cost of production 25 cents a lb.; the nett profit per lb. 9 cents; giving a total profit of R16,200·00. My factory is well equipped and correctly proportioned. My coolies are well-housed. In fact, my building accommodation is adequate.

Now, let me suppose that for the last three or four years I have been ordered to manure. Half the estate has been manured every year, and the effects of each application last two years, and no longer. Even your enthusiast will claim no more than that.

My yield has risen to 800lb. an acre (?). I find that the cost of production is slightly less than hitherto, but as a corresponding drop in the price of my tea has counterbalanced this, I need not take it into consideration. No doubt your enthusiast will say that here is a weak point in my argument at the very start; but, as I force my bushes with castor cake, which possesses few or none of the elements which produce strength and flavour, I contend that the quality of my tea has deteriorated.

Now, when I came to manure, I found that—

(1) The cost of manure (including application) was R60 per acre. I manured 200 acres; therefore, I spent R12,000.

(2) I had to take on another 100 coolies to pluck my flush. I advanced these coolies Rs.2,000, and the interest on this money, at 5 per cent., amounts to R100 per annum.

(3) My line accommodation had to be increased. I erected a new set of lines costing R1,000, and the yearly depreciation on these must be reckoned at R100.

(4) My withering space had to be enlarged. I extended my factory, spending R1,000 depreciation or R100 per annum.

(5) I had to buy more machinery, a new roller, a drier, shafts, pulleys, and belting. Altogether my machinery cost me R5,000. Depreciation R500 per annum.

I might also add that my weeds gave me more trouble, and that I had to take on another conductor; but, as these are days of retrenchment, I will allow these items to slide.

We find then that the cost of production, exclusive of manure, is 25 cts. a lb.

	R
320,000lb. tea at 25 cts.	80,000
Cost of manure and application	12,000
Interest on advances	100
Depreciation on lines	100
Do. factory	100
Do. machinery	500
Total cost of 320,000lb. tea at 29 cts. a lb.	92,800
Nett profits (at 5 cts. a lb.) on 320,000lb.	16,000
Original profits (180,000lb. at 9 cts.)	16,200
Balance in favour of manure	? ? ?

I contend, then, that manuring does not pay at present prices, and the sooner the system is dropped, the better it will be for the island. We have seen that a reduction of the tea estimate has forced up the price of tea ½*d*. Remove another ten millions (and I think I may safely say that ten millions of the tea exported are the result of manuring), and the price of tea will rise another penny.

I have stated my case, and now I will suggest a remedy against over-production. At present there is no duty on manure. Let the Government put such an *ad valorem* duty on artificial manures (*and* fertilisers) as will convince the manure faddists that their theories are absurd. After a time, the ten millions will vanish, but in the meantime, the proceeds of the imposed duty could be handed to the members of the Thirty Committee, to juggle with as they pleased. I would put no restrictions on them; I would merely suggest that, they should buy thirty long ropes (ready noosed in case of emergency) with part of the money.

As I said before, I am laying myself open to abuse in saying that the quality of tea deteriorates with the application of manure. But in the absence of any figures, I am content to rest upon this assumption till some one knocks it from under me.

"E. S. G." "adds his quota by giving the following

FACTS AND FIGURES.

Your correspondent, writing in the *Times* on the 19th instant appears to me to be wrong in his calculations, and the conclusions he arrives at are therefore erroneous.

For the sake of convenience I reproduce his figures, and alongside them will be found the necessary corrections:

F. S. E.	R
320,000 lb. tea at 25 cents ...	80,000
Manure and application ...	12,000
Interest on Advances ...	100
Depreciation on Lines ...	100

,, Machinery ...	500
Total cost of 320,000 lb. of tea at 29 cents a lb. ...	92,800
Nett profit (at 5 cents a lb.) on 320,000 lb. of tea ...	16,000
Original profit on 180,000 lb. tea at 9 cents ...	16,200
Balance in favour of manuring ...	?

CORRECTED FIGURES.		R.
180,000 lb. of tea at 25 cents	...	45,000
140,000 lb. of tea at 15 cents	...	21,000
Manure and application	...	12,000
Other items as per F. S. E.'s Memo.	...	800
Total cost of 320,000 lb. of tea at, say, 24 60	...	78,800
Nett profit at 9·40 cents on 320,000 lb. of tea say	...	30,000
Original profit on 180,000 lb. tea at 9 cents	...	16,200
Balance in favour of manuring	...	13,800

As will be seen from the foregoing, the error "F.S.E." has fallen into is in his estimate of the cost of obtaining the extra 140,000 lb. of tea which the manure has produced. The allowance I have made, viz., 15 cts. a lb. for this increase of yield, is sufficient to cover the cost of plucking, manufacture and transport, &c., and there is nothing else to enter against it, superintendence, weeding, pruning, &c., not being influenced by the additional crop—though the superintendent might be entitled to commission on the increased yield. The f.o.b. cost of the whole crop, therefore, instead of being 29 cts. a lb. as he estimates (which would be an abnormally high figure for an estate giving 800 lb. an acre) is reduced to 24·60 cts., leaving a margin of 9·40 cts. per lb. for profit, as against 5 cts. a lb. only before manuring was introduced. I have taken the figures "F.S.E." has furnished us with, not because I agree with all that they imply, but in order to show that even with a low selling price of 34 cts. nett, profitable results cannot fail to follow the application of manure if it produces an increase of 350 lb. an acre on the natural yield of an estate. Whether so large an addition can be reckoned on is open to very grave doubt. Personally I do not know of a case where such results have been produced, and anyone contemplating manuring operations in the hope of making the profits "F.S.E." foreshadows may be grievously disappointed.

The broad question as to whether manure pays or not is one which circumstances must decide, the element of chief importance being the selling value of the teas.

A REPLY.

ANOTHER planter sends the following reply :—

Your correspondent F. S. E. finds "that the cost of production is *slightly* less" on an increased crop, due to manure! It would be interesting to us all, if he would prove his case by giving us the expenditure for one, three or more years, on the 400 acre estate he instances, yielding 450lb. an acre without manure, or 800lb. an acre (shall we say only, 675lb.!) with manure.

One naturally hesitates before manuring a very weedy estate, so we will assume that the one in question is an ordinarily clean estate.

I would point out that in his calculations he will find, 1stly, that the actual cost—in these days of retrenchment—of superintendence, most of the contingencies, V. A.'s fees, general upkeep, weeding, pruning, tools, &c., will be practically the same, whether the estate is giving 450lb. or 675lb. per acre. It, therefore, follows that the cost *per lb.*, will be about one-third less on the higher yield. Secondly, he will probably expect his superintendent to pluck the heavier crop, at, say, 2 cents per lb., cheaper; and his manufacture, fuel, &c., should also cost a little less per lb. Thirdly, after his initial cost of Rs.60 an acre, say, half ton an acre, in his first application; he will probably find he will be able to reduce his cost to R.40, in his following applications, manuring only a third of the estate per annum, instead of half, and still maintaining his larger yield. The cost of manuring in the third year therefore equals only 2 cents per lb., supposing he applies only 133 acres x R.40, and secures a crop of 270,000lb. tea. Now, as to prices—contrary to "F.S.E.'s" assumption, I am of opinion that anything that improves the strength and vigour of the trees has a beneficial effect on the quality of the tea. This is very much a question of treatment, method of application of manure, time of application in relation to last pruning date, aud particularly, subsequent system of tipping, &c. "F. S. E." writes of castor cake as a "forcing" manure, surely this is dependent on the quantity applied, &c., However, we now look to our friend Mr. Kelway Bamber to provide us with a universal manure that will ensure strength and flavour, from any jat or stability of bush, on all soils, whether differing every 100 yards or not, on our enigmatical estate of 400 acres.

Does "F. S. E." consider that unmanured tea in Ceylon is improving or going back in stamina, and that some of his Maskeliya soil will grow tea for ever without cultivation?

I make the cost of production on the 675lbs. yield, 3 cents (1s. 2d.) per lb. tea *lower* than on the smaller yield.

TEA CULTIVATION IN SOUTH CAROLINA.

A "MESSAGE" FROM DR. SHEPARD.

LESS than ten years ago, and soon after the abandonment of last serious attempt to grow commercial tea in the Southern St it seemed worth the effort to Dr. C. U. Shepard, Summerville repeat the experiment on a much more diversified plan, in the that conditions might be found favourable to the successful deve ment of a new industry. It is not necessary at this time to e into a description of all of the "Pinehurst" tea gardens and the come of the various experiments instituted therein. It suffic state that all available sorts of tea, of soils and situations utilized, and very divergent results obtained which further inv gations may modify, but hardly reverse. All of which data are t published later, through the kind interest of the honourable Secre of Agriculture, James Wilson.

But in view of the chief motive underlying the work, and espec because of certain results recently established, which appare prove the feasibility of making commercial tea in the Sout States, it may be well to publish an account of the "Rose Gar patch of tea. Its site was an old piney woods pond, with a bl rich (in humus) but sour surface soil, overlying quicksand and lower, clay. The ground was thoroughly sub-soil drained, hea sweetened with burnt marl and deeply ploughed. About plants of acclimatized Assam-hybrid tea were set out at 6 by 6 "quincunx." Whether from the slowness experienced in overcon the original acidity of the soil, or from the comparatively fe growth of the seedling during the first few years in this res resembling its relative, the camellia japanica—little progress made from 1890, the date of the establishment of the garden, 1894, although some leaf was plucked from it in 1892.

Again the system of pruning practised at the start of the ex mentation, whereby clean stems were maintained, had to be a doned after the loss of many plants and a degree of disappointn which almost caused the cessation of further work in this directio

At present the garden contains about 800 vigorous bushes, one composed of many stems, the result of cutting out the ori main stem and inducing a luxuriant sucker growth. There are about 200 younger plants occupying the places where older died; they naturally produce less leaf. Altogether this garde less than an acre may be fairly regarded as containing the equiva of 900 plants in good bearing.

The output of green leaf from it has been as follows :—Cro 1892, 56 pounds; crop of 1893, 81 pounds; crop of 1894, 151 pou crop of 1895, 333 pounds; crop of 1896, 600 pounds; crop of 1 648 pounds; crop of 1898, 1,000 pounds to 1st September wit prospect of reaching almost 1,200 pounds by the end of the seaso

It is to be noted that there has been a material increase each over the preceding, amounting to almost, if not quite 100 per c with the exception of 1897, when a prolonged autumnal dro materially interfered with the leaf production. It is, of co impossible to foretell to what limits this expansion may extend b reaching that slight annual variation which marks the maturi the plant. But it would not be surprising if the outturn doubled within a year or two. Twelve hundred and sixty poun green leaf will afford 300 pounds of standard Pinehurst black te

On a basis of 900 plants in the "Rose garden," the production bush is five ounces of tea. If it were a full acre the yield w approximate 400 pounds. And if the plants had been place shorter distances apart, as is the practice in the Orient and at Pinehurst, the output per acre should be materially larger. average yearly production per bush in Japan does not exceed ounce; in China it is from one to two ounces; in India and Ce three to five ounces. In the last-named countries there are es which annually produce over 1,000 pounds of tea to the acre they constitute the rare exceptions; Oriental tea gardens us contain about 2,000 plants to the acre.

This gratifying productiveness of an experimental garden of al an acre affords good ground for the belief that commercial tea be grown in South Carolina in quantity quite comparable wit average yield of the most favourably situated Oriental countries. the "Rose garden" is not to be regarded as an exceptional re nor of difficult imitation. Two larger gardens, also formerly p woods pond planted with Darjeeling seedlings, promise succe

PRINTING—All kinds of Estate Weekly and Monthly Report and Account Forms, executed at our KARAPARUMBA PRESS.

MANURES.

Fish Guano. Steamed Bone Meal. Poonacs:—Castor, Mowra, Hoongay. **Saltpetre, Crude and Refined** (Nitrate of Potash.) **Nitrate of Soda. Sulphate of Ammonia. Sulphate of Potash. Muriate of Potash. Superphosphates. Phosphate Powder. Kainits Salts.**

Mixtures can be made in any proportion without extra charge. **Packing** can be done to suit transport by bullocks, etc.

Prices will be furnished on application for delivery either at our Karaparumba Works, Calicut, the Calicut Railway Station, Palghat, Mettapollium, Salem, or at our godowns in Cochin, Tellicherry, Mangalore and other places.

Quotations will be obtained and orders booked for any Manures not kept in stock. F.r.m.

rivalry within a few years. And yet others appear to be awakening to a more vigorous productiveness.

The cost of a crop of 300 pounds of tea from the "Rose garden," by reason of its greater productiveness, is much less than that from Pinehurst, as a whole. And yet it is evident that very material reductions might be secured were its area even only ten-fold enlarged, much more so did it contain 100 acres. The following tables show the actual cost of the several operations in the growth, picking and curing of the crop of 1898 in the Rose garden, as also the estimated and materially reduced expense for the same rate of production on a larger scale.

	Actual cost per pound.	Possible reduced cost per pound.
Pruning	3 c	2c
Manuring	3 c	2c
Cultivation	1½c	1c
Leaf picking	14 c	8c
Factory work	6 c	3c
	27½c	16c

A glance at the above table shows that the chief expense is that of gathering the leaf. Experience has demonstrated that a smart lad or grown girl can pick from a good "flush" twenty pounds of green leaf in ten hours, or, say, enough to make five pounds of tea. This should be done for 30 cents, or at 6 cents per pound. The supervision in the field will add 1 cent. With immature plants or poor "flushes" there is necessarily much more labour to be spent, and consequently more time in securing the same amount of leaf. Again, the "fineness" of the plucking materially influences its cost. The picking of a coarser and larger leaf or two from each shoot greatly increases the yield and lessens the cost. But with a medium leaf picking and Southern localities where labour is cheap, with an outturn of at least 400 pounds of tea to the acre, this expense should not exceed 8 cents per pound.

There remains to be considered the cost of superintendence and the fixed charges for the outlay in the establishment of the garden and its maintenance until self-supporting. As to the former, the cost will largely depend on the size of the crop; on a production of 100,000 pounds per annum it should not exceed 2 cents per pound of tea. The expense of putting the land in suitable condition for a tea garden should not exceed that for any other intensive crop. The cost of raising and setting out the tea seedlings will vary from $25 to $50 per acre, according to whether raised from domestic or foreign seeds. In the establishment of a large tea estate the initial expenses are necessarily heavy, but it should be borne in mind that once well done it is practically for all time. The best Japanese tea is said to be gathered from bushes 200 years old.

The leaf plucked from the "Rose garden," as indeed from the whole estate, is fine, *i.e.*, it very rarely consists of more than the Pekoe tip and two leaves, and then only to the first Souchong. Heretofore, and without the aid of a protective duty, it has been possible to sell all of the Pinehurst (black) tea at $1 per pound retail. It remains to be seen whether the duty will be repealed, now that hostilities have ceased, or, if not, what effect it will have on the price of the better grades of tea. But after all deductions—and they are not to be under-rated—it must be realized that there is a wide margin of profit between the cost of one pound of "Rose garden" tea if produced on a large scale, say 25 cents, and the wholesale price of an equally good imported tea, say 50 cents. A profit of 10 cents per pound means a profit of $40 per acre on an annual production of 400 pounds of tea. And higher profits per pound with increasing yield per acre will rapidly swell the income.

The "Rose garden" has apparently demonstrated that commercial tea may be successfully grown in South Carolina. The utilization of this knowledge may be along several lines, but all of them involve the erection of a suitably equipped factory, costing from a few thousand dollars upwards, according to the proposed scale of operations. In some countries the bulk of the tea leaf is raised by small farmers, who at the most only prepare it sufficiently to insure its safe delivery at factories in the larger, often distant, towns. Or in other districts the extensive tea estates erect factories sufficient to handle not only the output of their own gardens, but also that of the smaller producers in their neighbourhoods. As in all other branches of manufacture, the modern tendency is towards centralization and the cheapening of processes by increasing the volume of production. Machines have been successfully substituted for about all manual operations in the manufacture of black tea, and thus it has about that a well-equipped factory is indispensable in ma that sort.

The preparation of green tea still involves much and sl manual labour, and it is, therefore, questionable whether it ca profitably produced in this country in spite of a decided nat preference for this sort. Machines adapted for making this cla goods will surely follow the commercial realization of the tas the tea-drinking public.—*Indian Planters' Gazette.*

DEPRESSION IN THE INDIAN TEA INDUSTRY.

The one absorbing topic of the day just now, when the tea se is fast drawing to a close, is the present general depressio industry, and its future, which is undoubtedly shrouded in uncerta Hope as one may for some amelioration of the present situa we cannot disguise from ourselves the fact that we are face to with a crisis, and that a severe one, for tea.

As is natural in all circumstances of a grave question, discus are rife and diverse, and I incline to the view that a reasonable ex tion of the cause of our difficulties may not be without its advant when such a view is culled from an experience born of interc with those concerned with tea for the last twenty-five year would review, primarily, the antecedent events which have for years past been leading us gradually, but surely, to disas results, which have now culminated in a crisis.

In the first place the old or rather original idea was that onl land and lands with stiff soil required drainage, and even thi never carried out upon any definite system. By definite syst mean that the laying out of the drains with due considerati the gradient of the land and the physical nature of the soil wa regarded in past years, while the necessity of professional a was absolutely ignored, if not actually scouted. Subsidiary t initial error, so to speak, we find other disturbing factors v have borne a prominent part in accelerating the present depre in the tea industry. The chief of these, as we all know, has over-production by widespread extensions and the opening o large tea tracts.

This has unquestionably added to the weight of the millsto trouble which is dragging us down and has led to a glut in the ket of our commodity, which will be no easy matter to over so long as indiscrimnate supply exceeds the demand. perfectly true that much of the extensive tracts of which have been gradually opened out in past years by ca ists and promoters has not proved altogether unsuccessful; it is true that such opening out found favour in the encourage afforded by the falling off in the consumption of China teas a corresponding appreciation of and demand for Indian teas; bu question arises whether our ambitious and rapid progress in country has not carried us beyond our depth with unlooked-fo alarming celerity. Capitalists and purchasers at home and ab have, with wide and overstocked markets to select from, for years past been concerned with obtaining the best products at inal rates to the exclusion of inferior teas. This view leads t consideration of the wisdom of any future opening out or exte of tea tracts without professional opinion and advice; but I not anticipate my review of this part of the subject, and will t fore refer to the remaining factors, which, to my thinking, militated to some extent against the financial prosperity of th industry in late years.

It would be inconsistent, if not erroneous, to assume that the of exchange is one of the main opposing factors, though it is dif to resist the conviction that it has had some bearing upon the que of the present depression in tea. We have noticed that exch has played a part in the financial economy of our industry, but a small part relatively when we consider the pre-over-produ years; so this really may be set aside as *argumentum ad judiciu*

The several other adventitious circumstances which of late y have combined to wipe out the reducible or microscopic marg profit may be enumerated as follows, viz :—

1. Unseasonable weather and late monsoons.
2. Short seasons resulting therefrom.
3. Drought and injury to plants from various causes.
4. Inferior quality and small outturns of tea.
5. The impossibility of reduction of working expenses and of manufacture.

Without wishing for one moment to reflect in any way upon the planting community generally, or to detract from the valuable work which has been effected by the majority of our best men engaged in the tea industry, I cannot but think if they had been allowed a freer hand, and proprietors had insisted upon the necessity of professional advice in case of important extensions or the opening out of new grants, happier results than we now have to face would have resulted from the adoption of such procedure.

I may, I think, without fear of contradiction or controversy, state that where tracts of tea have for some years been opened out gradually under what may be termed the modern system, or scientific principles with professional advice, the results have been far from unprofitable. We have but to turn to some of the more prosperous gardens in the Assam Valley for a proof of this, and in this connection we find, indeed, that professional aid has, in the instances of even old estates, been wonderfully instrumental in their salvation. In evidence of this there stands out notably the case of a practically mediocre estate in Assam which was entirely resuscitated by the experience and energy of a well-known planter who recognized the expediency of taking professional advice; this garden is at the present time in a flourishing condition, and bears testimony to the value of the modern system of cultivation.

Turning now to the more scientific aspects of the subject-matter under review, or in other words to the modern system already referred to, physiology teaches us that the food has to travel to the plant, and not the plant to the food. The whole of the mineral and some portion of the organic substances that are necessary for plant food are obtained from the soil. A plant can only take up its food f solution, and hence for the land to yield properly it is essential t both water and air pass through it freely and rapidly. This can take place unless the land be thoroughly and systematically drai The ultimate maximum yield of a bush, other things being eq depends entirely upon the number of cubic inches of root space are at its disposal. It is not advisable to increase this by mak the distance of the bushes apart more than five feet.

The only other means available is by bringing the soil and sub into such condition that the roots can penetrate to a depth of five six feet, and this is only attainable by very efficient deep hoeing f the commencement of the garden and by thorough subsoil drain

It is now generally recognised as an axiom that all lands (no ma what their contour or the physical composition of the soil), if they suitable for growing tea as a successful commercial enterprise, n be thoroughly drained: this applies to plateaux, rolling and low- land with a gradient up to 1 in 15 as well as ordinary flats.

Survival of the Fittest.

Tea concerns commercially may be placed in two categories- those which have already exhausted their capital and are unabl raise more to carry on with, and (2) those in which the far-se promotors kept a reserve of capital to tide over the rainy day.

Until recent years the professional prospecting for tea land been very much neglected. There can be no doubt that tea c mercially is still a sound investment, therefore those with cap need not be frightened by the seemingly alarming views which be held by pessimists, nor by the theories of unsuccessful propriet

still it cannot be gone, or rather rushed, into as in former years, and due regard must be paid to selection of land and its treatment in accordance with modern ideals. There is still first-class tea land available in the province, and there can be no question that this only can possibly be made to pay in the present day. It is much better to take up first-class land at an initial cost of twenty rupees an acre (planters will understand what is comprised in these figures) than to obtain third class and at three rupees an acre, as the difference in annual yield is often 3 to 4 maunds per acre and the difference in sale price of the teas from 2 to 3 annas per pound. There is one chief point which should not be lost sight of, and that is that in taking up tea land the cheapest method in the long run is to obtain the highest professional advice available.

Verily "the old order changeth" and must of necessity fade into insignificance, but there is no reason whatever now, because we are face to face with a crisis which has brought about a depression in tea that we should fall into a state of morbid or hopeless despondency. And this now brings me to the subject of reduction of establishments. So far as can be ascertained, the powers that be in tea, apparently, propose to discount the effect of deficiency in crop, quality, and market value by discharging or dispensing with the services of present managers and filling their places.

This is a very weak policy, and is to be deplored upon several grounds, but on this point there is no necessity to dilate: it speaks for itself. However, as a set-off to this, while agents are setting themselves to reduce expenditure on tea gardens, there is no suggestion of any self-denying ordinance to cut down the Calcutta charges. For instance, to take a few figures roughly, let us say that to every pound of tea calculated to cost three annas six pies in manufacture, the agents add on two annas to cover charges in Calcutta for fees, &c. This would bring up cost of production to 5½ annas, and as, at present rates, tea sells at, say, 5 annas per pound, the natural result is a loss. It is a fair and reasonable proposition that agents should be content to decrease the present preposterous charge for their services by 25 per cent., and so help to meet the present difficulties with which we have to contend. There is no knowing what may be in store for us in the future, and for all we can say even next season may bring some material improvement to the depressed condition of our industry.

No, it is but a poor makeshift, and very false economy to dispense with the services of managers of tried ability and with many years' experience. It is, to use a metaphor, merely killing the goose that has laid golden eggs, for though at present there is a temporary stagnation in trade, there may be a sudden improvement in the condition of affairs.

And meanwhile what about the new broom which is to make such a sweeping alteration in affairs? Without going any further, one might apply as a simile the scriptural lesson which teaches the folly of patching an old garment with new cloth. It is rumoured that there will probably be about two hundred planters out of employment in Calcutta after the close of the present tea seasons. This is, no doubt, a deplorable state of affairs, and I hope will not prove to be true. We hear of a number of changes that are to be made in the Surma Valley and a number of men are leaving the field altogether, but let us hope only *pro tem.* Doubtless a similar state of affairs exists in Assam and the Duars, so the outlook for the moment is anything but bright for members associated with tea. . . . .
—NEFIRA CACHARITE in *The Englishman.*

DISTRICT ASSOCIATIONS.

CENTRAL TRAVANCORE.

A GENERAL MEETING of this Association was held at the Penshurst bungalow at 10 A.M. on Saturday, October 1st, when there were present:—

Messrs. F. Bissett, L. W. Crawhall, A. D. Deane, R. W. Cole, R. W. Courtenay, H. Holder, R. S. Imray, H. M. Knight, L. G. Knight, E. Latter, D. Macarthur, B. Laurie, A. E. Veale, F. M. Parker (*Chairman*), H. W. Baker (*Honorary Secretary*).

Proceedings of the last meeting were taken as read.

Read correspondence since last meeting.—*Approved.*

Cattle Trespass.—*Proposed* by Mr. H. Deane, "That the attention of the Government be respectfully called to the damage done to new clearings by the numerous herds of cattle from Kottayam and other low country places which roam about Sirkar and private lands, and that as a means of relief the Government be petitioned to erect a pound near the Church Hill, in addition to the one at the Araday, which is not only very small, but placed at such a distance from many of the estates as to afford no relief.—*Carried.*

Tea shipments per s.s. "Nurani".—*Read* and *approved* letter from the Secretary, U.P.A.S.I., regarding correspondence on the subject. *Proposed* by Mr. H. M. Knight, and *seconded* Mr. H. Deane, "That the Association approve of the action taken, and trust that the matter will not be allowed to drop, and that copies of the correspondence be forwarded to the Indian Tea Association in London, as it is considered by the Association that the action of the Agents in Bombay is quite unwarrantable."—*Carried.*

Currency Commission.—*Proposed* by Mr. H. M. Knight, and *seconded* by Mr. Laurie, "That this Association wishes to express its approval and thanks to their late Honorary Secretary, Mr. Granville Lowther Acworth, for the able manner in which he acquitted himself before the Currency Commission, and for the time he devoted to the subject.—*Carried unanimously.*

With a vote of thanks to the Chairman, the meeting closed.

PEERMAAD,
1st October, 1898.

H. W. BAKER,
Hon. Secy., C.T.P.A.

WHEN YOU CANNOT SLEEP.

So far as outside matters go a man can sleep almost anywhere. Habit settles it. A sailor sleeps in the forecastle of a tumbling ship, and a soldier alongside of a big gun in a bombardment. One of the best night's sleep I ever had was in the open air on a prairie in Western America, the grass for a bed, a blanket for a pillow and my horse for company—the only living thing within fifty miles of me. But, pshaw! that was luxury compared with some situations in which men sleep sound as bricks in a wall. Habit does it as we said.

Hence, Mr. Fred. Downs' loss of sleep had nothing to do with his being a commercial traveller. Commonly, these useful gentlemen can sleep wherever night overtakes them—in hotels or in trains, in quiet country towns or in the midst of a racket fit to drive anybody else fairly wild.

No, it was not outside, but inside matters that kept Mr. Downs awake. He tells it this way: "In August, 1890, I found myself a way below par, like many stocks and securities. I had no appetite, my stomach was cold and sour, and there was a nasty taste in my mouth that nearly made me sick. I tried eating light and simple food, but I had intense pain after it at the chest and sides, and between the shoulder-blades.

"Instead of sleeping I rolled about the bed all night long. I felt really more tired and weary than a man does after a hard day's work."

[At this point in Mr. Downs' story we beg to insert the remark that the sense of fatigue or exhaustion is the result of a loss of strength: and that it makes no odds at all whether the strength has been used up in labour or has dwindled away through lack of nourishment. Pump the water out of a cistern or let it leak out, it's gone just the same.]

"I got very weak," says Mr. Downs, "and had great difficulty in following my business as commercial traveller. I tried medicines right and left, as anybody would, but none of them seemed to hit my case. In this way a year went by. At last I made up my mind to see if your remedy would help me. I had often heard it well spoken of but never before had occasion to use it. I took it a few weeks and it did me a lot of good. My appetite improved, and my food agreed with me. For this good reason, I kept on with it and was soon as well as ever. It also cured my wife of indigestion from which she had suffered for years. (Signed) Fred. Downs, The Rookeries, Bradford Road, Brighouse, Yorks, Dec. 28th, 1893."

Mr. Samuel Dunn had the same trouble. We needn't repeat the general symptoms, as they were identical with those described by Mr. Downs. Alluding to the effect on his nerves, Mr. Dunn says that for eighteen months, dating from the spring of 1885, he did not know what it was to have sound natural sleep. On that, as we might expect, he grew so weak he often had to leave his work for a day or two at a time. He took the usual assortments of drugs

and medicines without getting any more good from them than Mr. Downs had done. It was always that way. Medicines don't cure because they *are* medicines; *they must be adapted to an understood disease*; that's the common sense of it.

"Finally," says Mr. Dunn, "I got so low that I felt I must have relief if I was to live much longer. In October, 1886, I began using Mother Seigel's Curative Syrup, and in a few weeks I was well, and have been so ever since. But for the good luck that let me know of the Syrup I might have been dead before this. (Signed) Samuel Dunn, 2, Well-field Street, Mill Lane, Warrington, December 29th, 1893."

We mustn't forget to say that Mr. Downs was cured by the same remedy of the same complaint—indigestion and dyspepsia—and if there is anything on earth that murders sleep as that does, we haven't heard of it. If Mother Seigel's Curative Syrup had no other merit, it would deserve the gratitude of mankind on account of its power (being no narcotic) to seal up aching eyelids and lock weary senses in forgetfulness.

MARKET REPORT.

COFFEE.

Messrs. Wm. Jas. and Hy. Thompson's Report of the Colonial Markets for the Week ending October 5th, 1898, states :—

Bank Rate 3 per cent. Bombay Exchange closes at 1s 3 15/16d. Brazil Exchange 8 1/32d. Rupee paper 3½ per cent. 62⅝. Silver 27 13/16d per oz.

A rather steadier demand has prevailed at auctions during the past week, the moderate supplies being well competed for. The few lots of fine Plantation Ceylon, Columbian and Guatemala sold well at very full prices. Brazil markets are steady.

According to Messrs. G. Duuring & Zoon, the stocks at the European ports on the 1st inst. showed an increase of 2,750 tons, and the total visible supply an increase of 14,730 tons, being estimated respectively at 205,050 tons and 402,800 tons, against 203,800 tons and 387,070 tons on the 1st September.

Futures close quiet at an advance of 3d to 6d per cwt., viz. :—Good average Santos in Havre, December delivery, fcs. 39, in Hamburg pf. 32¼ and No. 7 low ordinary Rio in New York $5.75.

Daily receipts averaged 12,000 bags in Rio and 24,500 bags in Santos.

CINCHONA BARK.

At the Dutch Sale, held on the 29th September, in Amsterdam, the large supply of 8,137 packages was offered as compared with 7,500 packages at the August sale, and 6,600 packages in July. A good demand prevailed, and nearly the whole of the supply was sold at steady prices, the average unit realized being the same as in August, viz., 4·05.

Sulphate of Quinine unchanged, steady, at 10d per ounce for spot.

TEA.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Re dated October 7th, 1898, says :—

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1898-1899.	433,324 pkgs.	448,315 pkgs.	16,677 pkgs.
1897-1898.	429,048 ,,	483,406 ,,	16,500 ,,

52,105 pkgs. Indian
18,440 ,, Ceylon
1,033 ,, Java.
} Total 71,548 packages were offered in public tion this week.

Deliveries of Indian Tea during September show an increase of over million pounds above September last year, and five million pounds f the commencement of the season. The stock of this growth, in Lon has for the first time this year fallen below the corresponding pe of 1897.

Indian. No material change has taken place in the market, altho here and there a slight weakness was apparent. The official wire g exports to U. K. for second half of the month as 11,750,000 lb., aga 10,900,000 last year, making the quantity from 1st April to end of tember 69,917,000 lb. agst. 69,050,000 lb. Avgs: "Poobong," 1/ "Amal T C Nagri," 1/6¼; "Dooteriah," 1/6.

Week's average of tea sold on Garden Account 1898, 40,020 pkgs. 8·33d. 1897, 32,750 pkgs., av. 8¾d.

Ceylon. Offerings were somewhat smaller, the market for all gr was strong, the better quality of recent arrivals continuing to impa good tone. The official wire gives exports to U. K. for Septembe 7,500,000 lb., against 6,250,000 lb, last year, making quantity from January to end September 74,500,000 lb, against 77,500,000 lb. estimates the quantity available for October as 7 to 7½ millions. Av "Amherst," 1/1; "Ragalla" & "Troup," 1/0¾. Average 8·42d., aga 8¾d. 1897.

Ceylon Tea sold on Garden Account 1st Jan. to date 1898, 887, pkgs., av. 7·76d. 1897, 877,376 pkgs., av. 7·66d.

		1898.	1897.	1896, 1
PEKOE SOUG.	(Ordinary leaf; fair liquor) ...	6½d	6¾d	6¾d
PEKOE	(Ordinary leaf, little twist; fair liquor) ...	7¾d	7¾d	8½d
PEKOE SOUG.	(Rather bold leaf; indifferent liquor) ...	5¼d	5½d	5½d
PEKOE	(Somewhat bold leaf; indifferent liquor) ...	5⅝d	6¼d	6½d

Java. The Javas passed with good spirit but without material alt tion in value.

Bank Rate 3 per cent. Exchange on London three months sight Calcutta 1/4⅛. Colombo 1/4⅛.

PUBLIC SALES OF SOUTH INDIAN TEA.

(AVERAGE FOR ALL INDIA 8·33d.) *October 7th.*

IN AUSTRALIA.

The feature of the week was the auction sales of Indians, at which over 2,500 packages were offered and cleared at rates showing an advance of about 5 per cent. on fine and 7½ per cent. on low grades, finest qualities remaining on a parity. Privately the demand has also been good.

Ceylons, owing to limited supplies and strength of the Colombo mar remain very firm. China's have had large sales, private business, to s extent, interfering with public sales. Altogether the tea market is sounder position than has been the case for some seasons past.—*Lea* Oct. 1.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 11th November, 1898.

Season Reports should be sent to the Printers, Messrs. Addison & Co., direct, and not to *Planting Opinion* Office.

Kadur.

Balur, 1*st Nov.*—*Weather.*—North-east showers in the evenings with a strong east wind every morning. Rain for October 13·40, against 7·60 last October. Total rainfall to date 103·30. *Prospects.*—Coffee looking very well all over the district. Leaf-disease of course prevalent where there is anything like a heavy crop. *Interesting Items.*—The popular Deputy Commissioner has been inoculated, setting a good example to the natives.

Pulneys.

Rain—has been almost incessant lately. *Crops.*—There is not much Coffee just about here (Neutral Saddle), but what there is is doing remarkably well. Crops are good, better than on the Lower Pulneys, probably on account of steadier rainfall, near higher range. Green bug has spread very much towards the West during the past year, but has not reached this saddle yet; in fact, I have seen no sign of it West of places 20 miles from this. Crops here are large, full and heavy, and will be ripe about January. Beans noticeably *longer* than on Lower Pulneys. Coffee here mostly under Natives, but well kept. Nothing but irregular cattle manuring—and doing very well too!

South Mysore.

Mudigere, 30*th Oct.*,—*Weather.*—We had a little fine weather, but again everything is gloomy, though there is little rain. This sort of thing is very bad for all crops. I am told that a large proportion of the paddy, especially that sown broadcast, will turn out light, and natives, therefore, foretell a large amount of floatage in the coffee. *Diseases.*—Leaf-disease is much complained of still, but some places are reported on the mind or "would be if we could only get decent weather," and a few others are said to have escaped serious affection. *Labour Supply.*—I do not think there is much to spare, but most people seem to have as much as they need, or is it perhaps only as much as they can afford on the small allowances agents are prepared to advance to those who require advances.

Health is fair. There is more fever, especially amongst imported coolies. All labour is much troubled about inoculation. A stranger to my coolies passed by, and I had great difficulty in getting a cooly to show him the way to a neighbour. My writer tells me that they all ran away and hid, fearing that he was an inoculator. It is a pity that a charge was not made for inoculation, to make a favor of it. Last time I wrote I gave you a Hindu rumour. Now I hear of one which is evidently of Mahomedan origin, though told me by a Hindu, viz., that the country has to be handed over to the "Roumi Raj" which has conquered the "Koompani," and in revenge the latter wants to reduce the number of people in the country. I never heard the "Koompani" spoken of as an existing force before. I suppose it is hardly necessary to explain that "Roum" is Turkey. *Grain.*—Prices remain about steady, but for some reason, salt has doubled in price, and the bazaarmen are putting this down to the sircar, saying that all salt now issued is poisoned and only the old stock safe. On the whole a few people badly want hanging, but the unfortunate thing is that the exact origin of all these rumours can never be traced.

THE DEVELOPMENT OF MARKETS.

INDIA.

THERE is a very considerable demand in this country for both Coffee and Tea. It is a demand that is probably capable of development, especially as regards Tea. It is a demand that cannot be gauged with the accuracy of statistics relating to the British, Continental and American markets, yet, nevertheless, the trade deserves to be studied by European planters more than it has ever yet been. As regards Coffee, there is perhaps not very much to be said, though probably the chief part of Indian demand is fed from Native estates. There must be a very large offtake of the lowest descriptions of coffee, there is a smaller but very steady trade in high-class descriptions. Prices of the latter are usually high: probably above the parity of London values; and the lowest sorts, almost refuse in many cases, at least yield something in India, while sale in England would perhaps not cover the cost of transport from estate to market and the usual selling charges. The stuff that is sold as "Coffee" in many of the bazaars of this country would probably be unsaleable at any price in Europe, unless purchased in bulk by manufacturing chemists! And we believe that the prices realised locally for medium and inferior qualities compare so favourably with those of similar descriptions in London, that the desirability of fostering the "country" trade is patent to all who have secured a footing in it. Whether the most effective and economical methods of distributing coffee among the towns and villages of India have been generally adopted, is far from certain; and it is probable that a little careful inquiry into this matter would amply repay the District Associations in coffee-planting centres.

Turning now to Tea, we come to a different state of affairs. There is a large offtake, no doubt; but it is not half as large as it should be. Imports of China Tea have continued despite the expansion of cultivation in this country. There are large quantities of dust and very low sorts of broken leaf sold in India; but the trade may almost be said to be in its infancy. Organization is sadly needed, and distribution in conveniently small lots at popular prices would most likely lead in a few years to the establishment of an enormous demand. A good deal been said from time to time about *packet teas.* For Indian trade, packets would need to be very small for most part; and, of course, the smaller they are greater, proportionately, is the cost of paper, wr ping up, &c. For our part, we doubt the advisability trying to push *packet* tea among the masses of the popu tion. The Anglo-Indian, the Eurasian and the higher cl Hindu and Mahomedan population appreciate tea a recognize the advantages of the packet system. But the lower classes *low* cost is almost the sole recommendat of a tea. They want something that they can afford, a the cost of carefully prepared packets is not within th reach. They want a very cheap description of tea, f warded in the most economical way to a conveni distributing centre, and there sold in infinitesima small lots at the infinitesimally small profits to wh many petty dealers in India are accustomed. We do advocate retail sales by the planter, or through age acting on his behalf. What appears to be wanted is a lo Lipton, a Native for choice, who will take this matter and push it on a fairly large scale, buying in the b market, contenting himself with small profits, and arranging that small parcels of tea shall be dangled bef the eyes of the public until the greater part of these pec become confirmed tea-drinkers. There was a time, r many years ago, when public-houses in England were v numerous and tea-selling shops comparatively scarce. H in India there are toddy-sellers in tens of thousands; t sellers might almost be counted in tens. Nor is t simply due to the fact that toddy is a village product all over the plains, whereas tea has to be procured from hills. The numerous depôts for the sale of Colombo arra the many "foreign liquor" dealers there are throughout t Presidency, go to show that the demand is not for pur local liquor, and is not due solely to the fact that supp can be obtained from locally-grown produce. We should glad to know if any planter has ever tried to cultivat trade in $3\frac{1}{2}$ to $4\frac{1}{2}$ anna teas, through native agents with native consumers. If so, a few facts as to his exp ences would be interesting, and if sufficiently fully set might help to show where the plan failed. That has not succeeded anywhere up to the present time, wo seem to be only too certain.

We take it that a great advance towards the developm of South Indian demand would be made if a large fact could be established to deal with the produce of a grou estates, with an expert blender available, and every applia for preparing and packing at the lowest possible cost. this touches upon another and an already mooted subj which could not well be discussed in detail in the cours our present remarks. The one point that we would earne urge on planters is this, to remember that after manufactu their tea at the lowest possible cost they can manage, t have a large market at their very doors, and should themselves out not merely to meet but to stimulate demands. Planters should not despise the "home trad as distinct from that with Home. Both Coffee and planters should do their utmost to encourage consump among the millions in India. In this work they will competitors no doubt, but they need not quarrel on t account. While seeking fresh fields to conquer, they sho not forget those near them; for it is a peculiarity of

Indian Coffee-planting industry, as well as of the Indian Tea industry, that distant markets have hitherto been cultivated much more assiduously than those "close home." It is not yet too late to remedy what has long been an obvious blunder.

NITROGENOUS MANURING.

To judge from one of the remarks made by a correspondent with reference to our paper on Electric Nitrates, it is possible that we may be thought by some of our readers to have advocated the use of nitrate of soda *alone*—that is, without admixture—as a fertiliser. This is not the case. We are not aware that nitrates have ever been so used. But phosphates in conjunction with nitrogen are known to have given a distinctly better yield of wheat both as regards quantity and quality; and the increase has more than repaid the cost of the manure. Some of our readers can no doubt tell us much the same as regards their own crops out here. Hence, it is not surprising that the use of basic slag has spread in England, notwithstanding the assertion that has been made that it is not the *scientific* farmer who uses it. One agriculturist explains that in basic slag we supply two out of the four important plant foods (one might almost say three, as the free lime in the slag liberates the potash held in the soil in an insoluble form), we therefore supply a sufficiency of minerals to enable the same amount of nitrogen to produce a more abundant crop. What is surprising is that so small an application as 5 or 6 cwt. slag per acre should produce such big results. These remarks apply to land that is not in high condition, or naturally a rich soil. The feeling in favour of basic slag arises, we believe, from the practical experience of many farmers that nitrogenous manuring for cereals proved a failure; the results of luxuriant growth earlier in the season being plenty of straw but little else, whereas on the land treated with phosphate, sturdy growth is found, and a good yield of grain. Of course, the failure of nitrogenous manuring in particular cases might be capable of some very simple explanation, for no system of manuring can be properly recommended for *all* soils under *all* conditions. It is well to note, however, that the use of basic slag *after lime* is not recommended. It is said that the effect of lime is to completely neutralise any benefit from slag for some years. It may be that nitrates have some similar "foe" to meet, and that the outcome of their use depends largely on the nature of the manures that have been used previously. The suggestion is merely thrown out on the chance that some of our readers may have something to say on the subject, or may be able to throw light on it.

NOTES.

Tea Seed in Cachar. Seed in Cachar is said to be late and small in quantity.

The Jokai (Assam) Tea Co., Ld. Up to 30th September this Company manufactured 3,005,680 lb. Tea this year, as against 2,899,040 lb. in the corresponding period of last year.

Tobacco. This crop is said to be doing excellently well in Behar this year, apparently under Native cultivation for the most part. Interesting experiments are being made in the Chittagong Division.

Tea in Lower Assam. A telegram to the *Madras Mail* states that a sudden fall in temperature has taken place in Lower Assam, and that everything points to an unusually early close of the tea season.

Coffee. The World's Visible Supply of Coffee on 30th September, 1898, was estimated at 401,710 tons, as against 351,310 tons on 30th September, 1897. The figures relating to Government crop in Java this year are only 97,000 bags, as against 445,000 in 1897 and 347,710 bags in 1896.

Ceylon Tea Exports. Tea Exports from Ceylon to the 25th ultimo, according to the Chamber of Commerce, are fully 5 million lb. in excess of those of the corresponding period of 1897; but to the United Kingdom they are nearly 700,000 lb. short. To countries outside the United Kingdom, total shipments are now over 19 million lb.

The British Tea Duties. The joint Committees of the Indian and Ceylon Associations to consider the steps to be taken in regard to the tea duties, were to hold their first meeting on Wednesday the 19th ultimo. In addition to Mr. Verner, the Indian representatives will be Mr. A. Bryan and Mr. C. C. McLeod.

Tea Sales in Colombo. At the public sale of tea at Colombo on 26th ultimo, about 6,297 pkgs. = 480,805 lb. were offered, of which about 4,023 pkgs. = 331,605 lb. were sold. The sale passed off with a very firm tone for all kinds at fully last week's prices. The best teas in the sale were: Glasgow, Ben Nevis, Devonford, and Columbia. Amongst low-country teas some of the best were: Talgaswella, Carbury, and Rayigam.

Producers and Exchange. Some planters consider that all producers in India are subject to the same excessive taxation that they consider the artificially inflated rupee imposes upon themselves. It is to be hoped that they will be cautious about instilling any such ideas into the thoughts of Native cultivators. Mr. Acworth, in his evidence before the Currency Committee, more than hinted at a Revolution as the outcome of an appreciation by the Native cultivator of his position according to Mr. Acworth's idea of it.

Ceylon Tea in Russia. The Ceylon men want a successor to Mr. Rogivue, to push tea in Ceylon. A Mr. Blumann has now been mentioned as possessing the right qualifications. The *Times of Ceylon* remarks:—He has lived many years in Russia, and has a long mercantile experience. He also married a Russian wife, and speaks Russian fluently. He does not, however, 'know tea' in the generally accepted meaning of that phrase. But neither did M. Rogivue when he left Ceylon and went into Russia single-handed.

Japan Tea. In a pamphlet published in Japan attention is driven to the extreme cleanliness of the Japanese, and to the fact that of the 93,000,000 lb. of tea imported into the United States in 1896, 61,000,000 lb. came from Japan. Some useful hints as to the making of tea are also given, and the general arrangement, and get up of the circular show that the Japan Central Tea Traders' Association from whom it emanates, are apt students in modern methods of pushing commercial commodities. Ceylon is not to have the advertising field to herself any longer !

Causes of Depression. A Cachar planter, writing to the *Englishman*, attributes the depression in the tea industry to the following causes :—Over-production by widespread extension and the opening out of large tea tracts; high exchange; unseasonable weather and late monsoons; short seasons resulting therefrom; drought and injury to plants from various causes; inferior quality and small outturns of tea; impossibility of reduction of working expenses and cost of manufactures. He asserts that 200 planters are likely to be in Calcutta, looking out for employment at the end of the year !

A dumping-ground for rubbish. It has been pointed out that the tea that goes to the Persian Gulf and the North-Western Districts of India is nothing but mere rubbish. There is, it is said, no prospect of ever being able to educate the poorer classes of Persia to look with any favour on good tea. Their specialty is red leaf and sweepings, and if they want it there is no apparent reason why Indian and Ceylon planters should not supply them with it. Indeed, it might be well to try to cultivate this trade so as to make Persia a convenient dumping-ground for the bestowal of all rubbish teas.

Coffee Estimates. A South Mysore planter writes us :—"With regard to Coffee Estimates, privacy could be secured by a few estates being grouped together and only totals sent in to Honorary Secretaries of Associations. We generally have some idea of our neighbours' estimates (with a few exceptions) so that no greater publicity would be necessary than now exists. I know there are a few extraordinary individuals who object to even their neighbours knowing their crops. The difficulty *here* would be the petty native planters, whose name is legion." It is a relief to know that there is *one* coffee planter, at any rate, who takes our view of this question. The pity is that there are not more.

Not Bison. There are no real bison in India, says a recent writer. Sportsmen out there are wont to indiscriminately style both the gaur (*Bosgaurus*) and gayal or mithun (*B. frontalis*) the bison; but in reality there are no veritable bison in India. In fact, throughout the whole world there are only two species of the genus bison extant—the well-known European bison, the auroch (*B. urus*) and the American bison, (*B. Americanus,*) strangely miscalled buffalo by our trans-Atlantic cousins, who have fully inherited the propensity of blundering in nomenclature inherent in us Britishers, if naught else. The shaggy coat and heavy mane characteristic of the true bison *per se* distinguish it from either the gaur or gayar.

Manuring Tea. After studying recent c spondence on the subject, the *Ce Observer* remarks :—"Judiciously carried out, there ca little doubt that manuring is a profitable operation. fact, the question has been asked as to what is the u stopping planting 'Extensions,' if instead, pla generally take to 'Manuring'? Say that 100,000 were manured so as to add, on an average, even 150lb acre to the crop, and we should get an additional outpu 15 million lb. of tea, or the equivalent of 43,000 additi acres at 350lb. per acre !—Perhaps, from this point of v manuring would cease to pay." We should say not, prov that the development of Markets is attended to simu neously with the development of crops.

The London Tea Market. Messrs. Gow, Wilson and Sta wired to Colombo on 27th ult reporting that the market gene was steady, and that good liquoring broken pekoes easier, while the market for poor liquoring teas was steady. The price of fair liquoring Ceylon Pekoe Souch was 6½*d.* and the average 8½ (same as last report). Re reported :—Tone of Ceylon Tea.—Common to medium k good demand at fully previous rates. Fair Pekoe Souch he quotes at 5½*d.* (same as last week) and the average 8 (¼*d.* down), 21,000 packages of tea were offered for sal which 19,000 sold. Of Indian Tea 53,000 packages w offered and 49,000 sold. The average was 8⅜*d.* advance of ⅛*d*).

Soil Analyses. Mr. John Hughes states that he received so many soils for exam tion and report during this year, that he thinks a tabul statement of the results (without the names of the esta would be of general interest to Tea planters because one thing to make the analysis and quite another thin draw correct conclusions from the results. In order make a practical report one should have a number of able results for comparison. Hence, soil analyses reports, require some practical experience in order to g useful recommendation in regard to the important con tuents, that require to be artificially supplied in mixture of manure. No doubt he is right, and any tabu ed statement that he may draw up will be of very g interest.

By-products and Auxiliary Crops. The depression in the Tea tr has caused a revival of an old cussion. Fruits, cardamoms,

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain ton :—

61·50	lbs.	Nitrogen.
57·38	„	Potash.
14·92	„	Lime.
13·68	„	Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the 1898-1899 crop of seed f the parent trees of above analysis at Rs.6 per pound contai about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere from the

MANAGER, ARIENKOW ESTATE,
Shencottal

&c., are being suggested as worthy of the notice of the planter who finds he does not get enough out of Tea. Of course, there is a good deal to be said in favour of suggestions of this kind, but on the other hand there are many planters who would do well if they concentrated all their attention on one object. If a man undertakes to cultivate peaches, apples, cardamoms and what not, for sale, he must be prepared to devote special study to each product, and special care. This needs time, and in many cases might easily involve neglect of tea or coffee, one of which, after all, seems likely to be the mainstay of the estate. We certainly think that some few of the younger planters might cut out a new and very profitable line for themselves if they would quit Tea and Coffee and try fruits, vegetables, &c.; but that is "another story."

Planters and Exchange. The Darjiling Tea planters have adopted a resolution:—"That this meeting views with great alarm the present proposal before Government for fixing exchange at 1s. 4d., as calculated to very seriously injure, if not to ruin, the Indian Tea Industry, and resolves that the Tea Associations of Assam, Cachar and all other tea districts, the Indian Tea Association, and also the Tea Association in London, should be addressed on the subject, with the object of taking united action, and if thought advisable, of drawiug up a petition to the Secretary of State for India, to be signed as widely as possible by all interested in Indian tea, praying that some relief may be afforded either by imposing a higher duty on foreign grown teas, in proportion to the difference in exchange or of altogether removing the duty from British grown teas as a counter-balance to the bounty practically being offered to foreign teas by the abovementioned rate of exchange.

Brazilian and Indian Coffee. There is evidently a good deal still to be learnt. A South Sylhet writer learns from letters from England that a great many Brazilian estates must close or carry on at a dead loss, as the low prices ruling for coffee will not allow of Brazilian planters paying such enormously high rates for their labour in comparison to what is paid in India; and that, taking everything into consideration, the Indian coffee-planter ought to put his coffee on the market at one-fourth less cost than his brother planter in the Brazils. These be bold words, but evidently they go too far. They help to accentuate some of our recent remarks about looking into the question of *cost* as well as that of price realised. There cannot be a doubt that both the Coffee and the Tea industries of Southern India suffer under very great disadvantages from being worked on a very small scale and having to compete with the produce of concerns worked on a very large scale.

Cross-bred Cattle. An instructive experiment was commenced in the spring of 1895 by the Marquis of Londonderry, the object of which was to ascertain the most profitable class of cross-bred cattle. Heifers of the Aberdeen Angus, Galloway, and West Highland breeds were selected and mated with a first-class shorthorn bull, Champion, of Sittyton and Collynie blood. The first and second year's calves from these crosses hav e all been treated alike, and the older ones (2½ years) have recently been weighed. The Galloway crosses, all heifers, calved in April, 1896, averaged 87st. 4lb. each. The Aberdeen Angus crosses, all steers, also calved in April, 1896, averaged 99st. 12lb., or 2lb. short of 100st. The Highland crosses, which are one month younger than the others, averaged 95st. each for three bullocks, whilst a heifer scaled 82st. The noteworthy feature here is the relatively high weight of the Highland crosses. The fame of the "blue-grey," cross which results from mating a shorthorn with a black polled animal, is widespread, but here we see a shorthorn Highland cross registering a daily gain in weight scarcely inferior to that of the shorthorn Aberdeen-cross, but the lesser age is, of course, slightly in favor of the former when the calculation is made.

Black Tea from Green Tea Leaf. The *Grocer* says:—"We recently saw a notice of an extraordinary process by means of which black tea can be converted into green tea leaf. It reminded us of an article which we read in one of the foreign wine journals, showing how white wine can be made from red grapes. At this rate it ought soon to be possible to prove that black is white and *vice versâ*. The process by means of which green tea is converted into black consists in first withering, and at the same time more or less oxidising (fermenting) the green leaf by submitting the unrolled leaf to the action of a current of warm, moist air at a temperature of 135 deg. to 145 deg. F. During this operation the tea is continually lifted up and allowed to fall, and fresh air is continually admitted to replace the air from which the oxygen has been absorbed. The leaf is then rolled and dried, or the juices may be first 'thickened' (with or without intervening second rolling), and the leaf finally dried. It is optional, but not preferable, also to submit the leaf to more or less of the ordinary fermentation process before the final drying." We rather fancy our Ceylon friends would be more grateful for information as to how to produce Green Tea from Black Tea leaf!

The Eucalyptus as a Fever Destroyer. The efficacy of the eucalyptus as a fever destroyer is frequently discussed, not so much because any one doubts it as because men question whether the leaf or the scent or the vat is the most useful part of the tree. Writing to the *Planter*, a correspondent remarks that some writers are only half correct in attributing the efficacious properties of the plant to the aromatic scent of its leaves. As a matter of fact, however, the tree is possessed of very powerful roots; these pierce through the bed of clay that retains the moisture, and drain marshy lands. General Rhodes Morgan, than whom, perhaps, the Indian Forest Department has known no more scientific enquirer into valuable details, records that in many parts of Italy, where *Pinus meritima* has been planted, the ground has been completely drained, and the malaria banished. Again, at Arcachon, in France, there was a very considerable tract of land, full of marshes, with stunted beech, oak and elm growing, the place being the resort of snipe and woodcock. The trees were cut down, and the whole area planted out with the turpentine-yielding fir. The result was that the ground was completely drained of all malarial moisture and the place became a sanitarium for invalids. In Algiers,

the planting of the eucalyptus has, in numberless instances, been productive of the absolute banishment of malaria.

LETTERS TO THE EDITOR.

FRUIT PESTS.

SIR,—I shall be extremely obliged if you, or any of your readers, can put me in a position to reply to the following inquiry from South Africa:—

"Are your" (*i.e.*, Indian) "fruits—all or any of them—attacked by maggots, and, if so, is there any chance of the mother-fly being *Ceratatis capitata* (Wied.)—*Citriperda* (MacL.)?"

HARRY ORMEROD,
Secretary,
U.P.A.S.I.

MADRAS,
31*st October*, 1898.

PEPPER.

SIR,—I notice in your issue of August 27th a 'par' on Black Pepper based on the remarks of the 'Planter' on the subject. I quite agree with you that the statement regarding the return per acre (Rs.250) reads almost as a dream—if it is not a dream. The pepper planter who, without any material cultivation can make an acre yield Rs.250 is indeed one of those happy individuals whom fortune truly smiles upon. Like the Editor of *Planting Opinion*, I only wish I could take up 100 acres of pepper in a favourable locality and exist.

So much for the dreamy side of the question, now let us turn to the reality. I know large extents of jungle in the Western Ghauts, where the pepper vine is indigenous, and where it has been cultivated for at least 20 or 30 years. Although before any blight attacked the vine the return was fairly good, still I am not aware that the return per acre was within measurable distance of the wild statements in the 'Planter.' Latterly very serious blights have had to be coped with and I am afraid with very indifferent results in some cases. Again the difficulty of rearing vines from cuttings or seed is very great, especially with seed as generally a very large proportion, give male or non-bearing vines. The 'Planter' seems to take it for granted that every vine will bear. Happy 'Planter'! I have seen a very large extent under pepper and, taking the good with the bad, comparing the number of non-bearing vines with bearing ones, and taking into consideration the amount destroyed by the elements, I cannot by the wildest stretch of imagination conceive how the 'Planter' makes such astounding calculations.

Perhaps the 'Planter' could tell us how such results are arrived at, and give us a few hints replanting with cuttings and rearing from seed; also a few hints as to how to cope with the various blights liable to attack the pepper vine.

GENERAL ARTICLES.

THE U.P.A.S.I. SECTION.

[UNDER THE CONTROL OF THE SECRETARY, U.P.A.S.I.

THE subject of the classification of coffee is still u consideration, but it is doubtful if much can be towards carrying out the suggestions lately made Mr. Graham Anderson. After consulting a leading fir brokers in London, Mr. Frank Mangles points out coffee prices depend (1) upon the particular estate on w the berry is grown, and (2) on the firm of cleaners to w the coffee is sent. Apparently, therefore, any ger classification of average prices would be impracticable, any attempt in this direction would be as misleading disappointing as the present "system". The diffe firms of cleaners do not appear to have the same stan of denominations, so that one turns out more "A" less "B" while another delivers less "A" and more " It would not be easy to decide which standard shoul adopted by Reuter's Agency when telegraphing quotat

* * * * *

Still, there is no doubt that an improvement of the pre arrangement (it really can hardly he called a *systen* desirable; and perhaps some experienced planter can sug away.

* * * * *

Correspondence concerning lady-birds has been co in freely, and it is now intended to publish the gist at as early a date as possible. The manner in w various scientists have responded to the inquiries mad the Association is most encouraging, and the efforts n by the Association in respect to the importation of l birds have evidently aroused considerable interest.

* * * * *

Mr. Graham Anderson, C.I.E., has sent in a collec of Mysore lady-birds, and it would be well if his exa were followed in other districts. More than one scie has thrown out a hint that we should search at home as as abroad for the natural enemies of the scale pests attack crops. The identification of species, &c. c probably be effected here, though at the moment no con tent man has leisure for the job. If not, the specin could at least be forwarded to England, and a re obtained from the best authorities there.

* * * * *

The Government of India has sanctioned the employm by the Mysore Durbar of Dr. Adolf Lehmann, B.S.A., P as Agricultural Chemist for a period of five years. It i be hoped that the services of this gentleman can still secured for the Mysore Province.

GREY BLIGHT ON TEA.

SOME little time ago, says the *Times of Ceylon*, we were sent sam of tea leaves diseased in some way unknown to the sender, but leaves when they reached this office were so dry that we reque our correspondent to forward specimens direct to Mr. Willis Director of the Royal Botanic Gardens at Peradeniya. We are s however, to hear that in this case it was not done, but in the cour a letter from Mr. Willis, he tells us that he has little doubt that disease is the same as that he has known for some months pa common in the Kelani Valley and round about Nawalapitiya. Watt reports that there is little doubt that it is the "grey blig

of Assam, described in the *Kew Bulletin* a few months ago (see *Tropical Agriculturiet* for September). Mr. Willis continues:—

It is a very troublesome pest, but can be kept in check by regular plucking, every two or three days, of all leaves found to be affected. If this is done frequently enough, the fungus is prevented from forming its spores upon the diseased leaves, and, in time, the disease may be almost completely eradicated. Of course the diseased leaves must be burnt as soon as picked. The disease is common on Camellias in Europe, and hence appears to take readily to the tea bush, which is the nearest ally of the Camellia. I see no reason to apprehend any very serious damage to the tea industry from this pest, which has been known in some districts for the last five or six years, but planters must be prepared to spend a little time and money at the first appearance of the pest, or they may find it gets much more serious. In dealing with diseases of this kind, there is very much truth in the old adage that "a stitch in time saves nine."

These are all valuable suggestions, for which we are much obliged to the Director as all our readers must be. As he reminds us, the disease is now so frequently met with in many places, that nothing is to be gained by concealment. On the contrary, it is well to put planters on their guard against it, so that it may be taken in hand on its first appearance, in which case it is not likely to be serious for long. We also learn from Mr. Willis that several men who have been following his directions have complained that the disease continues to get worse. This is, he thinks—as with the cocoa disease—merely the result of the fact that planters are getting to recognise the disease more readily; and probably, when they first noticed it, the estate was more or less thoroughly infected, so that, for some time, it will naturally continue to break out in new places.

TEA IN OUR SCHOOLS.

IN Collins' First Graphic Reader Series there is the following lesson on

MAKING TEA.

"Mother, let me make the tea this time."
"Have you ever made it, Milly?"
"No, mother, but I wish to try now."
"Well, take some tea from the can, and put it into the tea pot."
"How much shall I take?"
"Fill the spoon once for each one of us."
"One, two, three, four, five, and a big one for Frank makes six."
"That will do, now pour in some hot water, and set the tea pot under the cosy, so that the tea can infuse."
"How long must the tea Infuse?"
"Only a little while. The hot water will soon make nice tea for us. Can you tell me what tea is, Milly?"
"Yes, mother, I think I can. *Tea is made of the leaves of a plant that grows near the sea. Men pick the leaves from the plant, then roll them up, and dry them. When the leaves are quite dry, they are put into boxes and sent to us in large ships.* The tea plant grows in lands that are very far off, and the ships have to sail a long, long time before they get to us."

It almost seems as if an Educational Fund ought to be established for the purpose of providing proper "readers" for the young. We are informed that the illustration attached to the above delicious piece of unconscious humour shows a garden laid out in small beds like those for vegetables, with some carrot-like plants in three or four rows.

THE DISAPPEARING TEA TRADE OF AMOY.

FOR many years Amoy was one of the chief centres of the tea trade of China, the leaf exported from there having a character of its own. But this trade is now disappearing. According to the last report of the British Consul there, Amoy exported in 1877 over 12 million pounds of tea; in 1896 the export was less than $4\frac{1}{2}$ million pounds, and last year it fell to 1,616,933 pounds, and he believes that soon tea will cease to be a product of the district. There is little doubt that the extinction of the industry is due to the ruinous system of taxation. The heavily taxed Amoy black tea cannot compete with the untaxed Indian and Ceylon teas, while the dilatory and vexatious modes of collecting the *likin* lead to much of the leaf becoming damaged during transit. In the Amoy district tea gardens are to be seen which have run to waste, the comfortable homesteads of the once prosperous, tea-growers being in ruins. "Unless the system of taxation is reformed the prospects of this district are somewhat gloomy. There is as yet no indication of such reform, The only idea the authorities seem to have is to endeavour to obtain from the decaying industries as large a revenue as they obtained from them when in a more flourishing condition, and the only means to this end they seem able to devise is to increase the stringency with which the *likin* is collected, and thus accelerate the total extinction of the trade." Similarly the sugar trade of the district would have greatly advanced but for *likin*. The climate and soil are particularly fitted for the cultivation of the sugar-cane, while the people are industrious and skilled in the industry. The Japanese market, with a great and growing demand, is close at hand; yet the trade shows on expansion. Meanwhile Formosan sugar production is increasing and is untaxed; and, says the Consul, the freedom from the curse of *likin* more than compensates for any advantages the soil and climate of Amoy may may possess over those of Formosa. Again, there would be a hopeful trade in tobacco if it were not for *likin*. The tobacco dealers abroad discoversd that the Amoy leaf was very suitable for cigarettes, and a trade was beginning to spring up when the nascent industry was nipped in the bud by *likin*. The tobacco exported is grown in the immediate neighbourhood of Amoy, and is therefore not subject to *likin*; but the officials, in defiance of the treaties, having destroyed the trade in the interior, are now seeking to destroy that in Amoy itself. Even the goods exported for the use of Chinese abroad, such as paper, ironware, and coarse china, are being ruined by the local taxation. In a special report on the tea trade, which is appended by the Consul, it is stated that the best expert known in Ceylon after visiting the Amoy tea districts stated that under no circumstances could they be revived so as to enable them to stand the taxation at present levied in China.

RHEA.

THE time for planters in India and the East, generally, to seriously take in hand the Production of Rhea Fibre, has now fully arrived, and we hope, in the very near future, to receive more numerous

inquiries from our readers as to the best means of disposing of prepared filasse. For some time several factories in England and America have been engaged exclusively in manufacturing all kinds of textile fabrics from the fibre, and there are unmistakable signs that a fine future awaits the new industry. In addition to a profit obtainable from the preparation of the fibre, however, there are several other good points about Ramie cultivation. Besides being perennial, the plant requires absolutely no cultivation beyond thinning out (and the thinned out plants may be at once replanted in new ground) after attaining a height of three feet; the original root survives for thirty to forty years; the leaves are greedily eaten by cattle and are highly nutritious; and the best means of propagation are from root cuttings. Planters need lay out but little capital on this product, as the stalks are marketable without degumming, or additional profits may be realised by doing the degumming, and fibre-extraction on the estate. Thus, on the lowest computation, a return of £18 per acre is certain, with the expenditure of the minimum of labour and capital.

If Actual Results are required, here they are! Upon an estate in Mexico the outturn of cleaned fibre, in 1896, was 1,936 tons, and the price obtainable, in New York, was 250 dollars (£25) per ton. The total cost of cultivation and laying down in New York, including £5,550 (nearly £3 per ton) for carriage and insurance, amounted to $203,007 (Mexican), and the working capital was increased to $233,007 by $30,000 expended on machinery. After deducting $27,830 for commissions, the net profit reached $326,692, or 145 per cent. on the working capital. Such results leave ample margin for repayment of interest upon cost of land, and actually make it possible to repay the purchase money within a very short time, and still have left an estate bringing in a handsome profit, especially in countries where land is cheap.—*Produce World.*

A NEW "MARKET" FOR COFFEE.

BAGS OF COFFEE FOR FORTIFICATIONS.

THE *Times of India* was primarily responsible for giving currency to the following story (written at the close of August) by an Anglo-Indian resident of Guatemala, Central America:—

"We have just come out of the throes of another rebellion, and yesterday the 'General' that headed it fell into the hands of the Government soldiers. The President immediately announced the capture officially, adding that shortly after being taken the rebel chief died a natural death, probably of unmitigated disgust. But you would not suppose that the person who really put down this rebellion in Guatemala was none other than Mr. John Bull. One of his cruisers was knocking about in these waters, just what they were doing only John Bull himself knows. Then the rebellion broke out on the frontier, and as the mutineers were short of change, they swooped down with 300 men on the defenceless port of Ocos, and captured the place after hard drinking. At this port there lay some 8,000 sacks of coffee belonging to various British, American and German houses. Out of a part of these heavy bags of coffee they constructed a kind of Havana or Cavite on a small scale, and behind them prepared to resist the attacks of the Government forces. The rest of the coffee they had already arranged to sell for a fair price on the Mexican border, and thus fill the empty Treasury. These people are both warriors and financiers of the latest type. While this detachment was engaged in the delicious task of awaiting the Government advance and the sale of coffee, other army corps under experienced Field Marshals were undertaking extensive operations in the interior. At this juncture the said cruiser got wind of the fact that some British interests were endangered in Guatemala, and at once made direct for the port of Ocos. Here they found that the rebels besides appropriating the coffee had ensconced themselves on the pier, a large wooden structure, to prevent any Government troops from landing there. They had further laid trains of powder along the pier, and under all the rolling stock of the railway that has its terminus there, so that in case of a forced retreat they could at once blow up everything and cut off pursuit. The captain landed with 100 men and demanded an accounting. The rebel General asked him to sit down to a cup of coffee and rum and treat about the matter. Capt. Fagan declined with th and ordered them to leave the town immediat, elyfirst placing a coffee where it had been, and dismantling their coffee fortifica in case of non-compliance the entire revolutionary force to be b alive under the 8,000 sacks. They retired, and when the rebels other parts of the Republic heard that a British gun-boat was ag them, they held a council of war and decided that it was prude disband. The leader was caught shortly after, and thus the fo revolution—since I have been in Guatemala—passed into his The *Leander* then returned to San Jose, and the officers all came Guatemala City for a week, and were dined and wined here magnificent manner, both by the Government and each of the fo clubs, the Germans alone spending some 4,000 dollars in enterta them one evening. It seems the German Insurance Companies were saved heavy damages by the averted blowing up of the Ocos thought themselves bound to make a splendid show, and the of were certainly very much pleased at their generous hospitality. left town amid a rousing reception at the railway station, at lea an Irish friend of mine said. Business has been so bad here safety for life and property so endangered during the last six or e months, that Europeans have been leaving the country in g numbers."

COFFEE IN SOUTH SYLHET.

THE local correspondent of the *Planter* wrote recentl

This seems to have grown more during the last two months it did during the whole preceding months of the season, and alludes to both Arabian and Liberian. As I opened out 50 this season I had no time for much cultivation in the older gr merely light forking round plants and keeping jungle clear, this, although sometimes necessary as a makeshift, is a very substitute for an all-round *kodali*, and this applies to tea as we coffee. In tea the *kodali* can be sent down to the hilt pretty into the plants and do no appreciable harm to the roots, but if is done in the case of coffee you run a chance of greatly weake if not killing, your plants outright, owing to the coffee being of a surface rooter than our mighty Sylhet staple. I have very little disease, and what I have seen has been on the Lib variety in the shape of black spots turning into holes in the le but it does not seem to hurt old plants much. On my garden I have seen no disease of either variety, but on a n bouring garden a patch of three years' old Liberian caught sort of a disease which simply killed the plants to the surface root sending a bunch of shoots away again which had no sig disease. I was puzzled over the matter because plants gro side by side, one would go as I have described, and the other w keep all right. The patch, I allude to was allowed to get rathe heavily shaded and this cleared off all at once, and the p suddenly exposed to the direct rays of the sun. I have wandered if that had anything to do with it. Perhaps Coorg say something about this. Plants of this season's planting growing away beautifully, and are commencing to show their pair of primaries. The weather we have been having has appare suited them down to the ground. and I would say that the coup inches or so of rain we have had this week will still further their benefit. The older coffee plants of the district are ripenin their crop, and, considering the terribly trying time the plants last spring, the crop, by all accounts, is going to be equal to years. When I speak about "crop" it must not convey the idea to anyone that the same word would do when used by Coorg correspondent. There is very little coffee grown in S Sylhet, and what there is mostly either experimental or else g for private consumption, but still it is always worthy of b designated *crop*, however insignificant from a commercial poi view. We cannot but say that we have variety enough, as we no less than five—Arabian, Liberian, Blue Mountain, Marago and the indigenous Bengaliensis. I note in Coorg's letter Mr. Cameron's services have been lent to the U.P.A.S.I. b Mysore Government. The planters of Mysore and Coorg are congratulated upon this decided piece of luck if we may call i such a name when they only secured the boon by their own

MILLIE & REDMOND, late P. THOMPSON & CO., *Ootacamund, Engineers and Contractors.*

sight in making application and taking time by the forelock, instead of lulling themselves in fancied security and putting off taking action until the insiduously increasing mischief has become almost irreparable, as has been the usual custom of doing hitherto not only in coffee but in tea also.

In a later letter the same writer reports:—

I mentioned in my last that I thought this had grown more during the last two months than it had done during the previous months of this season. It still sontinues to grow rapidly with fine large, healthy looking, dark green leaves. If I may judge by appearances, the rain we have had during this month has done the coffee here a power of good, more especially the young plants.

FACING THE POSITION.

That tea will regain, if not its pristine importance, or at least recover the position it held four years back, we are convinced, says the *I.P.G.*; meantime we earnestly urge upon proprietors the obvious necessity of providing substitutes to lessen the losses of the results of unfortunate waning seasons. Many planters have been in the habit of looking upon tea as a gentlemanly occupation, and considering the suggestions as to dairy and poultry farming, fruit raising and the growing of day-to-day requirements for the multitude quite *infra dig*, and it is time these notions should be effectually exploded, for unless the prompt prosecution of other industries is set about forthwith, thousands of acres must lapse into jungle and scores of men—many of them with families—be thrown out of employment, while there are the imported coolies to be dealt with. In fact, our apathetic shareholders must bestir themselves if they do not wish to sacrifice all they have sunk in Eastern India, by taking the conduct of affairs out of the hands of those who, by misleading them for past decades, have landed them in the present sorry plight. There are at least a score of industries by which the financial condition of tea companies can be redeemed, but the local Managers, to whom these matters are perfectly well known, must be brought into direct contact with those who find the wherewithal. Social associations between Directors and shareholders have, in the past, been the cause of too much blind trust, and now that the result of reposing over confidence in the former by the latter but too apparent, it is to be hoped in the interests of the investor, is such may be not further indulged in.

It would be a waste of time and money to seek to bolster up gardens we know of whose area amounts to thousands of acres, even by the exercise of scientific gardening, or even the opening out of fresh land, as no returns could be expected for at least four years, while the present is a case of urgency. Use might be made of *bheels* which, if not included in the grant, could be rented from Government or zemindars, and as suitable ploughs, drills and other appliances are in stock in Calcutta, such crops as wheat and mustard could be laid down, the earlier after the rains have closed the better. Whether the proceeds would tide over next season we are not prepared to say, but as the cultivation of these cereals can be prosecuted and fitted for market by mechanical means in almost every detail, they ought to give some decent intake, that, aided by prudent drawing on the reserve funds, should carry a concern through next season. Once we get over 1899, if proprietors will take the present lesson to heart and prohibit extensions, tea will undoubtedly come round, but if once out of the wood, we return to the follies of 1893-94-95, there will most assuredly be a repetition of the present impending disaster.

Though tea manufacture may form the main operations of the planter, it must be obvious now to the meanest mental capacity that to rely wholely and solely upon it in the future is downright foolishness. Our outturn should be adjusted by the markets of consumption, which can easily be done by consulting the price lists of all countries in which Indian tea has obtained a footing, relying only on the Mincing Lane Circulars to guide us in so far as the requirements of the United Kingdom are concerned. The industry is on the verge of a revolution, and that revolution must necessarily be of the most radical, sweeping character. That vested interests must suffer is inevitable, and to use a somewhat vulgar expression, there is likely to be a "general row all round; but the crisis is one entirely for shareholders to deal with, and it will be necessary for them to assert themselves without fear or favour, unless they prefer taking their losses quietly, resting under the stigma of "people of no account."

TEA COMPANIES.

Ceylon Tea Plantations Company (*Limited*).—The Directors have declared the usual interim dividend of 7 per cent. (being 14s. per share) on the ordinary share capital, payable on October 27th.

Duckwari (*Ceylon*) *Tea Plantation Company* (*Limited*).—The Directors recommend a dividend of 5 per cent. on the ordinary shares after writing off £331 for depreciation, &c., and carrying forward £601.

Indian and Ceylon Tea Trust Company (*Limited*).—The following is the report of the Directors presented to the shareholders at an ordinary general meeting held at the offices of the Company, at 34, Nicholas Lane, London, E.C., on Friday, October 28th:—

The Directors, in presenting the first annual report and accounts, made up to 30th June 1898, regret that the period elapsed since the formation of this Company has been an unsatisfactory one for the tea industry generally. The chief causes of depression were the rise in the exchange and the fall in the price of tea, but the Directers now look forward to a general improvement in the conditions.

The experience gained shows that there is room for the establishment of such an organisation as this Company. The income receipts shown by the accounts may be considered satisfactory, and in normal and more favourable circumstances the result would undoubtedly be better.

The accounts accompanying this report show that the total income earned to 30th June, 1898, amounted to £3,061-4s 10d, and after paying interest and expenses of carrying on the Trust, a net balance remains of £2,189-1s 8d.

The investments of the Company are shown in the balance sheet at cost price, but the present state of the tea industry has necessarily caused some depreciation in their value.

Under these circumstances, the Directors regret that they are unable to recommend the payment of a dividend, and propose that the profit be carried forward. They have also resolved to forego the fees payable to them under the articles of Association.

In accordance with the articles of Association, Mr. Keith F. Arbuthnot retires from the office of Director, but being eligible, offers himself for re-election.

Messrs. Singleton, Fabian & Co., the auditors, do not seek re-election as such, as they have accepted responsibility for the secretarial work of the Company.

New Dimbula Company (*Limited*).—The Directors, in their Thirteenth Annual Statement of Accounts, are again able to congratulate the shareholders on the satisfactory result of the past year's working.

The yield of tea exceeded the estimate; the yield per acre was larger, though it was not an ideal season for flushing, and the prices obtained show a slight improvement on those of the previous year, while the cost of production has been reduced; on the other hand the rate of exchange ruled higher.

The estate is reported in good order throughout, including factory and machinery.

The area of tea in full bearing is 2,193 acres, according to the existing plan of the estate; a new detailed survey is being prepared, showing the various acreages more accurately. The extensions during the past two seasons amount to 152 acres.

The accounts now presented show a surplus of £22,751 11s. 5d. after writing off the amount of tea extension account, viz., £738 15s. 9d., and the amount of the factory and machinery account, viz., £238 2s. 2d. The Directors propose a dividend of 8 per cent. per annum on the "A" and "B" shares, and 6 per cent. per annum on the "C" shares, for the year ended June 30th last, a moiety of which was paid in March; and they further propose an additional dividend of 8 per cent. on all shares, and the placing of £6,000 to the Reserve Fund.

Maturata Tea Company.—A dividend at the rate of eight per cent. per annum for this new Company is good.

RHEA FIBRE IN INDIA.

Mr. Arthur A. Moss, Managing Director of the Rochdale Rhea Fibre Spinning Co., Ld., writes as follows to *Capital*:—

Sir,—My attention has been called to a notice in your issue of 28th July, 1898, respecting rhea fibre, and as this is likely to be prejudicial to the encouragement of the growth of the plant; I shall be glad if you will make use of the following information.

Many fortunes have been lost in trying to use rhea fibre as a substitute for silk, but this idea of its use is now as dead as Queen Anne. It is being used to adulterate silk for some purposes, such as the silk stripes in heavy cotton or woollen goods, or the silk effects in tapestry cloths.

The future field for rhea is where its great strength and lustre separately or combined can be made use of, and this field will only be limited by the cost of production, as there are now known processes which will degum the ribbons and leave a strong lustrous fibre for spinning. The offer you quote of £12 per ton, c. f. i., London, was for black ribbon, and I have every reason to believe it is a remunerative price to the planter.

I have used very large quantities of Indian black ribbon contracted for and shipped at under this price, and from many lots have obtained excellent results, but the majority of the shipments have been unsatisfactory. Firstly, because the plant has not been cut at the proper time, much of the material being immature or over grown, and in great proportion been too short in length; and, secondly, on account of the packing, the material having been packed damp and fermented during transit. The correction of these mistakes and the shipping of good material in good condition cannot add to the cost; and I, therefore, take it that what was considered a remunerative price for the bad material shipped will be the same for good material when the cutting and packing are understood. In support of this I have, during the last week, bought and contracted forward for a large quantity of China grown black ribbon at £15 per ton. Of this material I have worked about 50 tons, and as the Chinese understand the growth and packing, I have not had the same difficulty as with the Indian, and in almost every case have obtained good results. In China the collecting and getting to the coast for shipment is most difficult and expensive, and if they are already prepared to sell at £15 per ton, I don't doubt that in the near future £12 per ton will be a full price to pay to countries which are more favourable to the growth of the plant.

In the notice under report you say " good rhea filasse is worth, we think, nearer £30 per ton than £12 per ton."

It is necessary to explain that the £12 per ton was offered for black ribbons, and that the term filasse means the ultimate fibre as abstracted from these ribbons and freed from all epidermis and gum or resinous matter, and in a condition ready to be combed so as to parallel the fibres for spinning. There is a loss of over 40 per cent. on the best of black ribbons, and in addition to this, the cost of the degumming process. I make the cost of filasse from good ribbons costing £12 per ton at over £45 per ton.

To prepare good ribbons the stem should only be cut at the fully ripe age before the plant flowers or forms branches, and when the stem at the root gets brown, the leaves should be stripped from the stem by passing through the hand from top to bottom, breaking the leaf stalk away without dragging with it any of the peel or bark. The peel or cuticle should be stripped at once from the cut stem, and this can easily be done by simply inserting the thumb at the root end between the peel and the pith, and passing quickly up to the top end, thus getting off broad ribbons without any crushing. All China-grown ribbons are stripped in this manner, and I have none damaged.

There are many decorticating machines recommended, but the danger is crushing and breaking the fibre, and dividing the peel into too narrow strips. A good ribbon should be as clean, as long and as broad as possible.

To put the steam in a hot bath with a slight admixture of crude soda would facilitate the stripping and scraping, and then with some blunt instrument like a split bamboo scraping off the cuticle or actual outside bark. The ribbons should be then most carefully and thoroughly dried by being spread out or hung on rails; if placed in a green or wet state in heaps, they will ferment and the fibre be useless. It would be an advantage both for packing and in the after process to have the ribbons assorted into lengths; they should not be tied into bundles or packed so tight that the ribbons will in any manner be crushed, bruised or broken. If made for convenience into bundles, they should be tied loosely together with a ribbon, and it is essential that they are so packed that the ribbons will not in any manner be crushed, bruised or broken.

To make the above as clear as possible, I send you per bearer a sample of some of the best ribbons as shipped from China. These are not what we know as China grass or yellow ribbon which is a much more cleaned and finished article, also a sample of filasse as degummed from these ribbons, and a sample of the filasse con and ready for spinning.

I should be glad to be put into communication with any gro or exporters of rhea, and to give any further information in power.

PARAGUAY TEA.

(ILEX PARAGUAYENSIS.)

"H. D." writes in *Indian Gardening*: One often hears of Para Tea and the wonderful virtues ascribed to the decoction made the leaves and branches of the tree which yields it, yet how litt most people know concerning the history of this particular either as regards its habit of growth, or the manner in which th is manufactured. To the people inhabiting South America Para Tea is one of their most important economic products, and is ju necessary to them and serves the same purpose as our Indian China teas do to the rest of the world.

There are a number of plants which have some reputation as producing plants, the most notable being Ilex Cassine, the infu from the leaves of this tree going under the name of " Black Dr of the Carolina Indians. Ilex gongonha of Brazil, Ilex fertilis, Humboldtiana and others, and the confusion which used to exi to the real source of Paraguay Tea was entirely due to the produ so many different trees being sold under one name.

Ilex Paraguayensis, the true source of Paraguay Tea, is a nati Paraguay and Brazil. The Order of plants to which the tea bel is familiar to all of us, and is the same which supplies us with the H (*Ilex aquifolium*), the berries and branches of which are so assoc with Christmas decorations in England and elsewhere. Ilex P guayensis forms a good-sized tree in its native country, and del in a tropical temperature with a fairly moist atmosphere.

To show what an important plant it is to the people of S America, and the enormous quantity of the tea consumed by the need only be stated that the annual consumption is estimat 8,000,000 pounds, and besides this, 5,000,000 pounds is said t exported from Paraguay alone.

The preparation of the infusion of Gerba de mate, or Paraguay is neither difficult nor elaborate. According to instructions giv the Kew Museum Guide Books, "the leaves are scorched and d while still attached to branches brought in by collectors; they then beaten, separated, coarsely ground by rude mills and pack skins and leathern bags. The leaves are infused in small tea and the tea imbibed from the spout or by 'Bombilla' or tube wire network or perforation at the bottom." According to ano authority we learn that to prepare an infusion of matè or tea, " a spoonful is put into a gourd or cup, with a little sugar, the drin tube is then inserted and boiling water poured on the matè, w sufficiently cool the infusion is sucked up through the tube." mode of imbibing the tea reminds me of the natives of Sikkim drink their " Murwa " in the same manner.

When prepared, matè is said to have an agreeable slightly arom odour, rather bitter to the taste and very refreshing to the hu frame after enduring great fatigue. It is almost impossible for t accustomed to it to leave it off.

The medicinal virtues of Paraguay Tea are such that it acts in s degree as an aperient and diuretic, and if taken in over-dos causes diseases similar to those produced by strong liquor.

According to one authority, Dr. T. Crawdown Charles, a ta acid is present in a large amount, and as stated in the *Kew Bul* for May and June, 1892, "although matè is closely allied to coffe yields up its active principle in a different way, and it is slower coffee in yielding up its nutritious principles to boiling water."

We are told that there are three sorts of matè known in S America, namely, Caa-Cuys, the half expanded leaf buds; Caa- the leaf torn from its midrib and veins without roasting; and Guaza or Yeroa de Palos of the Spaniards, the whole leaf with petioles and small branches roasted. The active principle, th contained in tea and coffee is also present in the Paraguay Tea, not the volatile and peculiar scented oils which are so notice in the first-named products.

We have seen from the above that Ilex Paraguayensis, the p yielding matè or Paraguay Tea, is a plant held in very high mation by the inhabitants of South America, as it most certa deserves to be if all that we have read concerning it is correct, scarcely any doubt appears to exist that all the virtues ascribe

the plant are present. The question whether Ilex Paraguayensis will grow well in India is proved by the very fine specimens that exist in the Royal Botanic Gardens, Calcutta. There the plants may be seen in vigorous growth and in the best of health, and forming a group, on the east side of the Clarke avenue, close to the western entrance to the big palm house. The trees are shapely in habit and grow to a height of from 15 to 20 feet. A moist and rather shady position favours the growth of the tree, if those under notice can be taken as a guide to successful cultivation. Such a climate as that of Calcutta ought to suit the growth of Ilex Paraguayensis admirably, and, I believe, this can be proved not only in the Royal Botanic Garden, but in the gardens of the Agri-Horticultural Society of India.

In the North-West Provinces plants will grow with some amount of success, but not with the vigour which characterises the plant in the Calcutta Gardens.

I am not aware that any experiments have been made with the leaves of the Paraguay Tea plant in India, but I certainly think that some effort should be made to ascertain what value the tree would be likely to prove to the inhabitants of this country, especially as the product derived from it holds such a high reputation in all the countries of South America, and is exported in such large quantities. Why should not India also export Paraguay Tea?

PRODUCE AND PLANTING.

Tea in the Caucasus.

Writing in the *Pall Mall Gazette* about the resources of the Caucasus, Mr. E. A. Brayley Hodgetts says: "Of late years the great tea merchants of Moscow, notably the celebrated firm of Popoff, which has estates in China and offices in Mincing Lane, have started tea plantations in the Caucasus. These plantations, which were first tried as an experiment, have answered wonderfully well, and already large quantities of this Caucasian tea have been placed upon the Russian market. The first tea raised was sent to the late Emperor Alexander III., who had the courage to drink it, and pronounced it to be excellent. As nobody has ventured to ascribe His Imperial Majesty's premature decease to this cause, we are compelled to assume that this Caucasian tea is harmless as well as palatable. When I was travelling through the Caucasus I was very much surprised and amused to come against numbers of heathen Chinese, in correct Celestial attire—pigtails and all complete. They formed a most incongruous element in the scenery. I discovered that these gentlemen were tea-planters, who had been imported along with their own tea, and were now engaged in betraying their country's secrets to the barbarian. There is a colony of these Chinamen on the Caucasus. They have brought their houses with them, together with their manners and customs, and they get on uncommonly well."

Last Week's Tea Market.

The *Produce Markets Review*, in commenting upon last week's tea sales, says: "Prices for many descriptions of Indian tea have declined to a level which compares favourably with the lowest point touched in previous seasons, and now that the trade have reduced their stocks of old bought tea, a much brisker inquiry is probable. The strong statistical position, as will be seen by the figures below, is almost certain to have a steadying influence on prices, and it would not be surprising if some grades increase in value. It is a long time since the stock at this time of year has been less than in previous seasons. This is in a measure attributable to the smaller import, the falling off being 1,466,000 lb. The principal point, however, is the large reduction since the beginning of June, the stock then standing at 38,213,000 lb., or an excess of 5,978,000 lb. over the previous year. This, it will be seen, has not only been wiped out, but the quantity in the bonded werehouses at the end of the month is less by about 700,000 lb. than in September last year, the increase in consumption amounting to 5,089,000 lb. At this rate the estimated increase in the supply should be easily absorbed and, if the exports to other markets continue on the same increasing scale, the quantity available for this market may not show any excess of importance over the preceding season. This, coupled with the material diminution in the stocks of other growths, is almost certain to have a stiffening effect on the market later on, although heavier supplies coming forward will probably check any advance of importance for the present. The quantity of Ceylon tea offered this week has again been moderate, and, with a good demand, recent prices have been well maintained with occasional slight advances, and, as the quantity to be brought forward next Tuesday will show a further falling off, a strong market may still be expected. There was brisk competition for all grades, medium broken pekoes being particularly sought after, and there was very little to be obtained in these descriptions under $7\frac{1}{2}d.$ per lb. The supply of thick liquoring teas continues very small, and the few parcels showing extra colour in cup realised full prices. Common kinds remain firm at about late rates, $5\frac{1}{4}d.$ being practically the lowest quotation."

The Art of Adulteration.

The report of the Local Government Board shows that tea continues to be free from the distinguishing touches which once marked it when the bulk of it came from China. "Coffee" is still found to consist of chicory in large quantities. One sample sold as "French" contained as much as 80 per cent. Between seven and eight per cent. of the samples of sugar were impure, the impurities generally being an aniline dye used to colour the white crystals of beet sugar in imitation of cane sugar.

Exchange and the Tea Industry.

A correspondent writes: "I observe that in one of your late issues opinions were quoted, that with a high exchange foodstuffs on tea gardens were cheaper, and that the European staff required less pay. With regard to the former it is difficult to see how the rate of exchange can affect the price of foodstuffs, say, in Assam, and with regard to the latter I can only say that, notwithstanding the fall in the rupee, the pay of the European staff generally has got smaller and smaller during the last twenty years, while bonuses, commissions, and some other perquisites have almost entirely disappeared. The argument in favour of a low rupee as far as tea is concerned seems to be that the sterling value of tea and the cost of labour in the tea districts are not affected by the exchange; therefore, given a low exchange, it takes fewer pounds of tea (in sterling) to pay the Indian expenses. I suppose the same rule applies to most Indian exports.'. —*H. & C. Mail.*

PROSPECTS OF THE TEA TRADE.

A Vague rumour has been circulated that one of the most firmly established of British institutions—the five-o'clock tea table—is showing signs of approaching dissolution, says the *Financial News*. The news induced a representative to approach one of the leading tea brokers in the City, Mr. George Seton, of 120, Bishopsgate-street Within, to obtain an authoritative opinion on this point in particular, the effect of the alleged approaching event on tea shares, and the prospects of the tea trade generally. Mr. Seton believed that the rumour was utterly unfounded, and that the excellent custom was as general as ever.

"The consumption of tea," said Mr. Seton, "is steadily increasing among all classes, and I may tell you in confirmation of that statement that during last month alone the statistics show an increase of over 1,000,000 lb. above those of September last year."

"Is it not the fact, however, that many eminent medical men discourage the practice of tea drinking?"

"It is; but I am not so sure that even they themselves practise what they preach. The late Sir Andrew Clark, I believe, was an example of this class of Mentor. He is said to have often condemned the five-o'clock tea, and then gone straight home to enjoy the luxury at his own house. What the doctors really condemn, and ought to condemn, is the way in which tea is often prepared."

"Does that remark apply to all tea?"

"Well, China tea does not require the same strict attention as Indian and Ceylon. The latter now form nearly nineteen-twentieths of the consumption, and only the cheaper qualities come from China. This British tea is excellent, and gives a strong, dark liquor, quite equal, if not superior, to many of the China teas, but it requires a little more care in preparation."

"Does the darkness of colour indicate any superior quality?"

"Not at all. The light, straw-coloured liquor was quite as good and strong; but housewives imagine that if tea produces a good dark shade it is stronger and better, and so the growers humour them by treating the leaves in a particular way."

"Are you in favour of still further reducing the duty on tea?"

"Well, I am one of those who think there is no hurry for that. At the present time we may take the value of China tea as about 4d. a pound and the Indian tea at 8d. a pound (without duty). If you

add the duty, which is 4d. per pound weight, you find that the duty on China tea is 100 per cent., while that on Indian tea at 8d. is only 50 per cent. A reduction would therefore be more favourable to the China than the Indian tea, and the result would be that a large quantity of cheap rubbish would be put on the market. In course of time, too, the China, or non-British, tea trade would probably revive, and in that way the interests of companies and others engaged in the Indian tea trade would no doubt be injuriously affected."

"Is that view held generally?"

"No. There is another party which holds that a reduction of duty would lead to increased consumption and increased business. They do not think injurious competition such as I have pointed out would be likely to follow. However, I hold to my own views on the subject."

Our representative afterwards called on Mr. Wilson (of Messrs. Gow, Wilson and Stanton, tea brokers, 13, Rood-lane, E. C.). Mr. Wilson insisted that five-o'clock tea was as popular a custom as ever, and could not imagine how it could be supposed to be falling off. "Not only is it as popular as ever," he said, "but it is rapidly spreading, not only here, but on the Continent. The great bulk of the tea sold is consumed by the masses. Even if the five-o'clock tea were suddenly to cease as a 'society' institution, it would really have little or no effect on the total consumption."

"Can you give me any figures in regard to the home consumption?"

"I can. You will see from our circular for October that for the four months from June 1 to September 30 this year there has been an increase of 5,000,000 lb. in the quantity of tea delivered in England over the quantity received for the same period last year. That year only showed an increase of 2,000,000 lb. over the corresponding period of 1896. That does not look like any check in the habit of tea-drinking."

"It is said that there is over-production of Indian tea. Is that true?"

"Quite the contrary. The estimated surplus of the crop for the whole of this year over that of last year is only about 3,000,000 lb., while, as I have already said, the consumption for only four months has risen by 5,000,000 lb. over the figures of last year. As a matter of fact, I anticipate a deficiency this year—a circumstance that has only occurred twice since 1889. The supply will therefore be really under the demand."

"Was there not a decrease in the home consumption last winter owing to a boom in cocoa?"

"Well, there was a slight decrease, I admit; but it was a purely temporary effect caused by immense quantities of new cocoas being thrown on the market. Dealers had to stock all these cocoas; but I think you will find that, as a matter of fact, the great bulk of that cocoa is still in stock and unsold. The figures did not indicate the actual quantities consumed, but only the amount delivered for consumption."

"Then you think the prospects of the tea trade, as regards the producer, the shareholder, and the merchant, are good?"

"I certainly do. Tea drinking has now become such a firmly-established British institution that it bids well to last in all its vigour for many years, if not centuries, to come. Holders of shares in sound tea companies have nothing to fear."

LEAF PLUCKING, &c.

A WRITER in the *Pioneer*, under the *nom de plume* of "Sirocco," seem to have rather electrified the planting districts by unfolding a plan for giving a better tea and not reducing quantity. Had this gentleman lived a few years ago, doubtless his services would have been eagerly sought, but he comes with his theory a little too late in the day, as tea at 6 or 7 annas will not admit, as it did in former years, of experimental dodges such as we have heard were practised by one company some few years ago. We never exactly heard the end of this experiment, but the natural presumption is, that it was not a rabid success, else we would have heard more of it. This oxidation system, as it was called, was supposed to be kept a profound secret, and was to add a penny or two pence per pound to the average of the happy possessor's crop, but alas! the best laid plants of mice and men, &c., were again exemplified, and if we mistake not, the result was a 1d. or 2d. per pound less than the average of the district, and teas were denominated toast and water, and hungry beggars looking around for something to put quali some kind into them. The *nom de plume* "Sirocco" has vividly bro up these lights of former days, but we can scarcely think that "Sirocco" now writing and advocating going round a garden e five days, and picking off everything that put its nose out, is same "Sirocco" who was to revolutionise the system of tea-mal some few years ago. Of course, it is difficult to lift the veil and out who "Sirocco" is, but we had thought that a paper of standing of the *Pioneer* would have made somewhat more sure o facts before publishing a thing of the sort.

About 15 years ago a young planter in Cachar, on his blush as a Manager, startled the community of planters commencing to treat his garden on the lines laid down "Sirocco," and at first his triumph was great, as he fo ahead in outturn, and the success and remarks of his neighb began to dwindle away for a time, but later on murmurs a were heard, which continued to swell till the climax was reac when rumours were afloat that a change of management was cont plated, and the undaunted passed on to another district, to a electrify the planting community by his "Naya dustoor." Na ally there is not much to talk of in the districts but tea and making, and any one can imagine better than the writer describe, the sensation which any new departure in any way conne with cultivation or manufacture is criticised and discussed; shakes of the head of the wiseacres, who decline to commit th selves in any way, but who eventually are always ready with told you so," no matter how the experiment turns out. "speech is silver, but silence is gold" is nowhere better exempli than in the tea districts. But to our subject. Our young b if he did nothing else, gave the districts he visited a good dea amusement in the way of argument and discussion, but alas! the knoweth him no more. It seems to us that it is a most insid sort of thing for a paper like the *Pioneer* to publish a letter dea with one of the most, if not the most important functions in mak tea pay without having satisfied itself that there was some truth likelihood of what they were writing about being fulfilled, and consider that it might lead to very serious damage being done an estate by some of the younger bloods trying it on. The o members of the planting body are too wise to be led into tempta in this way, but it does not require much imagination to conc that some of our younger ones, goaded into trying to do somethin appease the wrath of agents, might go in for following this sys out, and doubtless as we have said above, blinded from perha few weeks' results, wreck the prospects of the garden for that yea

The commonest laws of supply and demand may be applied to tea bush as much as to the price of the tea which it makes, and less a liberal growth of wood is allowed to be made, the bush comes weak and emaciated, and cannot possibly give a strong fl which is necessary to give a good liquor. It is a curious fact, one which is well established, that a bush under a system of co plucking thrives and becomes more vigorous under the treatm whilst if fine plucking has been pursued for any number of ye the bushes become puny and weakly, and look as if they had no in them. A great deal, we consider, of the complaints of wan grip in the liquors of Cachar and Sylhet teas is due to the plucking which has been going on in many gardens during the five or six years. Look down the list of teas sold from those tricts, and there is precious little difference in the averages betw *teelah* and *bheel* gardens, and *bheel* gardens have been notorious their weak watery liquors. How are we to account for the fal off in the fine prices attained by many gardens in these two distr as well as in a good many instances in Assam? Until this yea was rare to see a 7*d.* average from Assam, but unfortuna this year it has been of very frequent occurrence. How we to account for this deterioration if not in some such way a have alluded to; partly no doubt, it may have something to do the atmosphere, but not entirely, and we cannot think our plan have lost their cunning in preparing the leaf. No, we must for the cause, or at any rate part of it, in the treatment of bushes, and no doubt this deterioration, making all due allowa for climatic influences and a "slump" in prices, have been cause some way in the treatment the bushes have been receiving the few years, and we think that sufficient attention has not been to this. It is only human nature if agents keep "dikking" a prices, that planters will pluck finer to save their own reputa but we doubt the wisdom of it in the long run.—*Communicat the "I.P.G."*

UNEXHAUSTED MANURES.

The value of unexhausted manures has for years past been a fruitful source of disagreement 'twixt landlord and tenant in every county of the three kingdoms. It is a subject on which much might be written, but we do not know that any good purpose would be served by going into it as exhaustively as our space would permit at a time when it has been so thoroughly discussed elsewhere. The report of the Royal Commission on Agricultural Depression, which has recently been published, deals with the matter, and the current issue of the *Journal* of the Royal Agricultural Society of England also devotes much space to it in an article by Sir John Bennet Laws and Sir Henry Gilbert, whose views upon this, and every other agricultural question, must always be reckoned with. This article deals with the report of the Royal Commission, but devotes most of its strength to the consideration of the value of unexhausted manures. The experiments at Rothamsted are cited as instances of the views set forth.

In considering the value of manures which may be lying dormant for a season in land, many circumstances must be taken into consideration. Local conditions must be thoroughly understood; the weather since the application of the manure must be looked to; and last, but by no means least, the valuer must have a thorough knowledge of the soil and its constituents. Given all these data, a certain effort might be made to put a monetary value on the manures which an outgoing tenant may be leaving behind him in his holding. But, as we said before, the subject is one fruitful in disputes between landlord and tenant, and, we fear, will always remain so. Legislation on the subject may or may not—opinions differ—be advisable or necessary. The farmer, who looks to the law to protect him, knows that it takes years of toil, and labour, and the expenditure of capital to put land into what in a horse we should call "condition." No matter what form of manure is used, a certain proportion of it remains, for a time at least, dormant. It may safely be said that all manures must of necessity remain a certain time in the land before their action as plant foods commences. The experiments at Rothamsted date back over a considerably longer space of time than do any others that we know of. In this way they are of considerable value as given certain definite results under certain known and well understood conditions; but this does not remove them from the position of being mere local experiments.

The use of artificial manure, as manure, is probably not yet more than half a century old; before its advent the farmyard was the source the farmer drew on for his top-dressings, and old leases stipulated very strictly against this source being ever suffered to fail. Farmyard manure came as a natural fertiliser to the farmer; it was only when the chemist demonstrated the value of the artificial manures that they gradually came into use. But it is with values from a monetary standpoint, after they have been put into the ground, that we are now concerned. Legislation, it seems to us, cannot do much to aid the farmer in assessing the value of the manures he is leaving behind, in the ground. That there is a value is well known, but the law cannot put an arbitrary price on it.

Summarising the Report of the Royal Commission, the main conclusions arrived at on this point are:—

1. When manures containing organic matter, such as those produced by the consumption of hay, straw, cakes, corn, etc., have been applied to the soil and grown a crop, the unexhausted residue of their fertilising constituents is yielded up to future crops only gradually, but much more rapidly on light than on heavy soils. Much the same may be said when organic matters, such as rape cake, are directly used as manures.

2. The value of the manure produced by the consumption of different cattle foods varies very greatly, and depends upon their composition. . . .

3. When nitrate of soda is used as manure, its nitrogen does not enter into fixed combinations within the soil, but nitrate is dissolved in the soil-water, and unless taken up by vegetation, much passes into the drains, or into the subsoil beyond the reach of the roots of the crops. When salts of ammonia are used, part of the ammonia is temporarily taken up by the soil, but it is, more or less rapidly (according to the character of the soil and of the season) converted into nitrate, and is then subject to loss by drainage as when nitrate of soda is used. The loss by drainage will, as a rule, be the most when these manures are applied to grain crops, but materially less when applied to root crops or to permanent grass, as these crops have a more extended period of growth, tending to keep the soil-water nearer the surface, and to greater utilisation of the nitrogen.

4. When these artificial nitrogenous manures are used for grain crops, they leave some nitrogenous crop-residue (stubble and roots); the more the greater the amount of increased produce due to the manure. When used for root crops there will, as a rule, be much more of the supplied nitrogen recovered in the crop than in total produce (grain and straw) of a grain crop. When applied to permanent grass there will also be much more of the supplied nitrogen recovered in the increase of crop than when applied to a grain crop; and there will at the same time be more crop residue in the case of permanent grass than in that of a grain crop.

5. When superphosphate, basic slag, kainit, or salts of potash are applied as manure a portion of the phosphoric acid and potash is readily taken up by vegetation; but a large quantity soon enters into fixed combinations within the soil, especially in the case of the heavier soils, and this is very slowly available to future crops Hence the compensation value of the unexhausted residue of these manures is very small.

6. To draw a distinction between the landowner's and the tenant's fertility, and to assign a commercial value to the latter, must always be a difficult matter; and especially must it be so, as some soils contain vast stores of natural fertility, and others very little. It is to be hoped that the evidence which has been brought forward, and the comments upon it, may be of some service to those who are called upon to act as valuers in cases where questions of compensation for unexhausted manures become subjects of dispute.

The Commissioners spent much time and labour in examining witnesses and in collecting evidence, but we do not see that we are any further advanced by the result. The whole difficulty lies in the proper difinition of the *meum et tuum* as between landlord and tenant. Each side has a much more comprehensive view of the former than of the latter, and we do not think that a Royal Commission or the House of Commons can do very much to finally settle the point. The point that all these varieties of detail accentuates is that valuation that may be quite right in one case and in one locality may be quite wrong in another case or in another locality. Legislation, therefore, to be based upon common sense, must insist upon valuations being the results of, and based upon, experiments of vegetable growths. How experimental plots are to be protected and their results measured upon every farm we cannot quite see, but it is evident that nothing less will serve to arrive at a true measure of the values of unexhausted manures and feeding stuffs. Indeed, it is certain that plots of unmanured ground would have to be left in every field in order to arrive at a comparison between the manured and the unmanured soil. So that as this seems to be impossible, we cannot see how further and stricter legislation on the lines of the Royal Commission's report will help either the farmer or the landlord, although we do see how it might be an excellent thing for the land agent and valuer and the solicitors of both sides.—*Land and Water.*

THE CURRENCY QUESTION.

Mr. E. Harcourt Skrine has addressed a long letter to the Secretary of State for the Colonies, to go before the Currency Committee. He criticises the Memorial of the Planters' Association of Ceylon and submits proposals very similar to those of Mr. H. Dunning McLeod, except that where Mr. McLeod advocates the minting of sovereigns and half-sovereigns at Calcutta Mr. Skrine proposes the minting there of one 12*s.* 6*d.* gold coin, which—taking exchange at 1*s.* 3*d.*—would represent Rs.10, and so fit in with the existing Indian and Ceylon note issues. The sovereign would, he observes, necessitate an entirely new Note issue and is in itself a coin of too high value for the currency requirements of a native population. On the other hand, a 12*s.* 6*d.* Indian coin might at home largely supersede the half-sovereign, which is said to be very uneconomical as not wearing well.

The letter referred to is as follows:—

New University Club, St. James Street, 9th May, 1898. To the Right Honorable J. Chamberlain, M.P.

Sir,—As an owner of tea property in Ceylon, I have the honor to offer some remarks on the subject of the currency which has, I understand, been dealt with in a memorial to the Colonial Office by the Ceylon Planters' Association. That memorial had not been published

when I left Ceylon last month, and it was, therefore, not in my power to address any representation on it through the official channels, but, inasmuch as I deduce some very different conclusions from the premises upon which the case for the planter is there argued, I venture to hope that I may be allowed to submit this letter for your consideration.

In so far as the Planters' Memorial is descriptive of the mischievous results to the Ceylon Tea grower from the enforced contraction of the currency, it must command the loyal support of all producers, but, when it goes beyond this, to recommend as a remedy the recoinage of silver on the basis, as I understand, of a somewhat lower Exchange for the rupee, I think it is time to bring to light some of the fallacies that in my opinion have obscured the judgment of the drafters of that memorial.

To instance these fallacies I must refer you to clauses 20 and 26 of the memorial.

The concluding paragraph of clause 20 says: "The rate for Peasant Labour in the Central, Western and Sabaragamuwa Provinces appears to have remained fairly constant at about three days' labour for a rupee, but that rate had only recently been attained in 1870. The rate in 1864 was generally a little lower."

Clause 26 says:—"With reference to the possible readjustment of local wages and prices measured in silver, while we find that there is in Ceylon a slight tendency towards increasing wages and a more general tendency towards increasing prices such increase bears no actual proportion to the progressive decline in the gold price of silver and it can hardly be attributed thereto. It is our opinion that the date of such a general adjustment of wages and prices is uncertain—that it will probably be remote, and that it may be postponed for an indefinite period of time."

The object of both these clauses is to establish the contention that India and Ceylon as silver-using countries are incapable of re-measuring their commodities in gold. I admit that there is much apparent justification for this contention, opposed though it be to an inevitable natural law, but the fact that it is so opposed should have led the planting body to regard their inferences with suspicion.

The Planters' Association accepts the fact that the rate for peasant labour has remained constant at about three days' labour for a rupee from 1870 to 1898 as proof that the decline in the gold price of silver has not resulted in a proportionate rise of wages. It is the purpose of this letter to show that while the labour wage has, it is true, remained constant at three days' labour for a rupee, the value of that wage to the cooly has been enhanced fully 40 per cent. during that period—or the equivalent of the fall in silver—by compensating advantages.

To trace these it is necessary to give a brief review of the labour wage for the past 34 years.

The Memorial admits that (1) during a period of par of Exchange, 1864 to 1870 the cooly wage was rising to some slight extent. That rise was commensurate with a stable trade price for coffee, and may fairly be taken to indicate a normally appreciating labour wage.

(2) A second period, 1872 to 1881, was a period of great inflation, coffee prices rising from 65s. per cwt. to 130s. This inflation was reflected in Ceylon by correspondingly higher cultivation. Labour that had in previous years been paid off after crop, to return to distant homes in India, was kept on for manuring and other works. Consequently the normal condition of a slowly rising wage was arrested, and made up to the cooly by this new found employment during the slack season. This period of high cultivation, the latter years of which balanced the first fall in silver, may be said to have ceased in 1881 when leaf disease and a collapse in the price of coffee brought the country to the verge of bankruptcy. It was succeeded by

(3) A period of transition from the cultivation of coffee to that of tea. During this period, 1881 to 1885, the cooly wage was, it is true, still constant at three days' labour for a rupee, but the coolies were often not paid at all, and on some estates worked for years on a bare subsistence in rice. On estates worked with reserve capital, a very vigorous task was exacted, such as is certainly quite unobtainable from the cooly of 1898, and a fuller value to the producer was undoubtedly obtained for the same wage. The argument of the apparent uniformity of the wage at the period preceding tea is, therefore, of little account. The coffee enterprise, while favoured by the exchange, may be compared to a ship with a favouring breeze struggling vainly against a maelstrom. Indeed, so disastrous to abour was the ruin of coffee that, notwithstanding the collapse of silver which accompanied it, wages that should have risen accordance with a natural law, were actually lower, estimated in balance of earnings available to the cooly than they were when exchange was at par. The natural result of all this was that country was being rapidly denuded of coolies. With these conflicting influences at work, it is idle to assume that the uniformity wage had, up to 1885, anything necessarily to do with the questio

Period 4.—Subsequent to 1885, the uniformity of wage argum is still further discounted by the altered circumstances to the cooly tea. Whereas in coffee, a large proportion of the labour force paid off to return to their homes at the end of crop, the women t remained worked half time, and the children not at all, the wh Tamil family finds, in tea, a constant full wage all the year round, a the women and children—the least useful laborers in coffee—h become the labour most in request in tea. The wage continues same "three days' labour for a rupee," but the earnings of the Ta family have increased fully 40 per cent., or very nearly, if not qu the equivalent of the fall in the gold value of silver, which the Pla ers' Memorial contends has had no such result. These advanta to the cooly (equivalent to a direct rise in wages) have been furth added to by improved journey facilities to India. The Southe Indian Railway to Tuticorin, made in 1875, gave the cooly direct co munication with his Indian home, superseding a toilsome march many hundred miles by the circuitous Northern Ceylon route Mannar, a route which was quite impracticable for weakly wom and children. I am satisfied that this view of the question has be entirely overlooked hitherto, and that, if it is fairly sifted, it will found that the cooly has been more than compensated for the fall the purchasing power of his wage by the increased volume of wa earnable, and by easy access to his country.

The contention of the Planters' Memorial—that prices have mained unaffected by the fall in silver—can be similarly tested the history of the rice market. This article less than any oth produce lends itself to re-measurement with the rise or fall of precious metal used as currency, because it is cultivated on lan that can grow little else.

It will be found that previous to the great famine in 1876, rice w selling in Kandy at R3 per bushel, and in 1895, previous to the l famine at R3·50, or a rise of 16 per cent. The latter price, howe by no means represented the real rise in value paid to the Indi producer, for his cost of transport in 1896 had been enormously duced by railways and cheaper freights. If allowance is made this, it will be found that the price received by the Indian r grower in 1896 was some 30 to 40 per cent. higher than in 1875, that here again the natural law of re-measurement of the commod in the currency had been at work.

In these two main instances—the cooly wage and the price of r —a nominal but deceptive sameness of rate in Ceylon is used as argument to support the contention that these commodities ha not re-measured themselves in silver, and therefore, will not measure themselves in gold, if the latter currency is resorted I arrive at the opposite conclusion, and am of opinion that if depletion of the Indian original currency—silver—is rectified by influx of gold to restore the equilibrium between currency and co modities the producer equally with all other classes—will be bene ed. Mr. Allan Arthur, in his *Standard* letter has shown the d advantages certain to recur by a partial re-opening of the mints silver, which is what the Ceylon Memorial advocates. The result Ceylon Tea, of such a policy, would be to foster the existing ov production, which is likely, in any case for some years to be a grea hindrance to profits than the recent high Exchange.

On the other hand, the introduction of a gold standard will ha the following beneficial effects:—If the transfer is made at a f rate, and I consider a fair rate to be that which was ruling before t American Legislation which led to the closing of the Indian Mint 1893, and which I will take for this and other reasons, at 1*s.* 3*d.* rupee—the results to the Tea Producer will be (*a*) he will hav fair amend made to him for the unduly high rate recently forced up him; (*b*) the stringency of the money market, as evidenced by p hibitory Bank rates of interest will cease; (*c*) the English invest will acquire confidence and lend money on mortgage in Ceylon a per cent. where he would not now (under the uncertainty of e getting his capital back) lend it at 10 per cent; (*d*) there will b mitigation if not an end to the recurring periods of inflation a depression which have been most injurious to sound enterprise a must continue to occur with an untrustworthy currency mediu There will be less phenomenal profits, but they will be consta

BREECHES TRADE.

Breeches-making is a *specialité* with us. **Mr. Smith,** the proprietor, deals with every pair, and we warrant turning them out to satisfaction as regards fit, style and workmanship.

(*e*) The transition to gold will furnish the opportunity for reconsidering the cooly wage. If the Southern Indian rate of 4 annas for men and 2½ annas for women commands a full supply of labour there, the Ceylon rates of 6 annas for men and 5 annas for women, taken in connection with the new journey facilities, would appear too high. At any rate the subject would have to be re-considered, if only to supersede the custom of making profits on rice which has always been a considerable factor in Ceylon in the wage question. These profits are likely to be very considerable if rice comes to be re-measured in gold, and, being always open to misconception, it would be better to abandon them in favour of a reduced wage. (*f*) The steadiness given to the cost of production would induce the planter—instead of looking to the fall of Exchange to help him—to develop his own latent economies. There is no doubt that labour is not nearly as efficient as it might be, estates having been flooded with new and untrained coolies supervised by young men from England who are gaining their experience at the expense of the Industry. (*g*) When these results have been worked out, it will be found that there is little to fear in the competition from silver-using countries on which so much stress is laid in the Planters' Memorial. Our China competitors will be unsupported by cheap capital, as in Ceylon, and rice—the food of the China cooly—must rise in price as the gold countries purchase it. The quality of China labour must also deteriorate in proportion as it is ill-paid and ill-fed.

I have ventured to suggest the transition from a Silver to a Gold currency at the rate of 1*s.* 3*d.* per rupee not only because it appears a *just* rate, but also because it will lend itself better than any other to the double necessities of England and India, seeing it would be represented by a gold coin the equivalent of 12*s.* 6*d.* in England R10 in India. The present stock of rupees is not more than cient for token requirements, and it must be remembered tha burden of currency work in the East will always fall on the t coins, *e.g.*, in monthly payments for labour the individual wage deducting food supplies but seldom reaches R10. This fact dis of the idea that the demand for gold for circulation in India ever in any way compare with the like demand for it in Eng where the labour wage is so much higher, and food is not made of the terms of payment.

This letter, of course, accepts the theory that the Indian Go ment was justified by the cyclonic disturbance to the curr created by American legislation, in contracting the Indian curr to meet a special danger; but the object having been served, bound to revert to a sound principle which, at the present stag only mean a *bonâ fide* Gold Currency for India.—I have the hon be, Sir, your obedient servant,

TEA.

CHINA.—The sales this week have been of little moment, says the *Commercial Record* :—

Auctions presented 7,039 packages, and passed off with a dull tone.

INDIAN.—Public auctions totalled 48,900 packages against 50,609 packages last week, and 52,200 packages at this time in 1897.

The better enquiry previously noticed has enabled buyers to deal with the comparatively large quantity brought forward since the 1st inst., without prices being affected to any appreciable extent. Although the quality of most of the Assams and Darjeelings has not been quite so desirable as in September, and quotations were in many instances consequently rather lower, still, it has mainly been of a useful description, and at the present low range of values the teas should go readily into consumption at home, while the exports of British growth shew considerable development.

A fuller selection from Travancore and other parts of South India was included in the catalogues. The assortment generally was not very good and results in most cases were disappointing.

For 37,700 packages on Estate Account 8⅜d per lb. was obtained, contrasted with 9d per lb. for 98,000 packages and 9½d per lb. for 26,203 packages in the two preceeding seasons.

CEYLON.—Only small supplies, comprising 12,900 packages were available *versus* 18,000 packages on the 4th inst. and 16,400 packages a year ago.

Notwithstanding this reduction in the size of the sales there was more irregularity in the bidding. On the whole, however, little alteration occurred in prices. Low common and inferior leafy sorts were occasionally neglected, while medium Pekoes met with scarcely so much support owing to a temporary slackening of shipping orders. Broken Pekoes as a rule were dearer, especially those with strong infusions. Finest kinds brought higher figures.

The average has risen 8¾d per lb. On the 6th inst. it was 8½d per lb., and 8¾d per lb. in 1897.

JAVA.—Nearly 2.000 packages of direct import went off steadily without material alteration.

Deliveries.

The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns, were :—

From 1st to 11th Oct., 1898	6,376,520lbs.
„ „ 1897	6,010,274 „

During the week the following have been printed for sale by public auction :—

	Sold. Pkgs.	Withdrawn. Pkgs.	Total offered. Pkgs.
India	43,526	5,396	48,922
Ceylon	11,881	982	12,863
Java	1,617	355	1,972
Total	57,024	6,733	63,757

Also 634 packages from second hands.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated October 14th, 1898, says :—

QUANTITY BROUGHT TO AUCTION IN LONDON
FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1898-1899.	482,634 pkgs.	461,519 pkgs.	18,649 pkgs.
1897-1898.	482,338 ,,	500,300 ,,	16,875 ,,

49,310 pkgs. Indian
13,204 ,, Ceylon
1,975 ,, Java.
} Total 64,486 packages were offered in public auction this week.

Movements of Tea in the whole of the United Kingdom from 1st January to 30th September, as shown by the Custom House returns, exhibit a satisfactory increase in the re-export of Indian and Ceylon Tea. Duty payments of Indian Tea also show a considerable increase. Figures for home consumption are really more favourable than appears at first sight, owing to an exceptional duty payment on about three million pounds of Tea made at the end of September last year.

An encouraging business has for some time been transacted in Indian and Ceylon Tea for Continental and Foreign Markets, this outside competition materially assisting the London Auctions.

Indian. The last two weeks heavy Auctions have afforded a good test of the strength of the market, and supplies have been readily absorbed without reaction in prices, while competition has been general and well sustained. Averages :—"Amal T. Co. Dooteriah," 1/7¾; "Poobong," 1/6.

Week's average of tea sold on Garden Account 1898, 37,815 pk 8·29d. 1897, 38,846 pkgs., av. 9¾d.

Total Tea sold on Garden account 1st June to date 1898, 342,682 av. 8·84d. 1897, 345,689 pkgs., av. 9·11d.

		1898.	1897.	1896.
DUST.	(Fair ordinary, dark liquor) ...	3½d	3¾d	4¼d
FANNINGS.	(Red to brown, strong rough liquor) ...	4d	4¼d	5d
BROKEN TEA.	(Brownish to blackish, strong liquor) ...	6d	6¼d	6¾d

IN AUSTRALIA.

MELBOURNE, October 8th.—Holders of China teas are firm in their ideas of value, and in the mejority of cases advances are being asked. The position is an admittedly strong one, and points to one of two things, either a falling off in the demand for Foo Chow description or in advance in prices. The former appears the less probable, such extensive decreases having occurred in the past that a reaction is naturally expected. The position of supplies is an interesting one; 3,000,000 lb. in round numbers have come to hand by the first five boats for the colonies, and cables state that the season will close with an export of 4,750,000 lb. which means another 1,750,000 lb. to come forward. Presuming that Melbourne obtains 1,000,000 lb. of thi total added to stocks in bond gives only 1,902,000 lb. in sight as ava for nine months' consumption, which, without allowing for export de averages 240,000 lb. per month. Stocks in private warehouses, of c may be large; but for once in a way importers appear to have the comfortable position this season. A good business has been done, co over 1,200 packages of Panyongs, buds, and S.O.P.'s at full rates. C continue firm, 900 chests being placed. Indians have also been in de good sales being made. As a whole the market is very firm, an change would, from all appearances, be towards higher values.

MELBOURNE, October 11th.—A catal ogue of 183 chests and 64 half

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N. B.—Remittances should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

IMPORTANT NOTICE.

The Offices of this paper having now been removed to Madras, all remittances should be made payable to E. C. Duff & Co., Proprietors, *Planting Opinion*, 16 and 17, Armenian Street, Madras, who will also attend to all advertisements, &c.

Letters to the Editor should also be addressed to the Madras Office.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 18th November, 1898.

Season Reports should be sent to the Printers, Messrs. Addison & Co., direct, and not to *Planting Opinion* Office.

Coorg.

Pollibetta, *3rd Nov.—Weather.*—Smart shower on 1st. Though cloudy, there has been no rain since. *Crops.*—Picking Siddapur way. This side there is no appearance of crop being on till near the end of the month. Preparation for crop in active progress. *Plant-diseases.*—"Leaf" still in evidence in parts. Parts attacked early have recovered. Price of grains has been easier for some time.

COFFEE.

A London correspondent recently observed: "Coffee is now low enough in price, in all conscience, to stimulate consumption." Taking another point of view, the *Financial News*, in an article that we publish elsewhere, remarks that "the present position of the Indian Coffee planter can hardly be described as comfortable, and that the best

he can hope for is a speedy consumption of the Brazilian product now in stock." Our London contemporary also gives a table of prices during the last 23 years, which would seem to show that the evil days of 1882 to 1886 are being repeated. Not a word is said, however, of the fact that low exchage has greatly counteracted the depression in prices, so that 75*s.* to 93*s.* in 1898 means something very different to the planter from what 75*s.* to 108*s.* meant in 1881. Nor is any notice taken of the fact that the fall of sterling prices of Coffee has at least had the beneficial effect of checking production in countries where it might have been vigorously extended had prices been more encouraging. For instance, at the first annual meeting of the shareholders of L. & H. PINTO, Limited, a Company lately established to develop certain estates in Mexico, three products were mentioned as those to which attention had been mainly devoted. Tobacco was one, India-rubber another, and Coffee a third. It will be at least satisfactory to the Indian coffee-planter to learn that Tobacco is being pushed much more energetically than Coffee. The reason is clearly stated. The Company had not found so good a demand for Coffee as for tobacco. Still the demand was good enough, and presumably the price, too, to encourage the hope that Coffee also would repay attention. Mr. PINTO explained exactly what had been done by his firm before the Company was formed, and subsequently by the Company itself. About eight years ago, he and his brother and Mr. RENDON acquired the estate of Mano Marques, in the province of Oaxaca, which they thought was very well situated and would prove a valuable property. But, of course, when they bought a property that was practically a jungle, there was an enormous amount of work to do to put it in order. Having bought the land, they set to work to improve and plant it. In the first instance, they cleared several thousand acres of the land and planted coffee. In the first year they planted between 50,000 and 100,000 trees, and although they made some mistakes at first as to the treatment of the plants, yet they learnt by experience, and they have now a plantation of 300,000 coffee trees. All these are not yet in bearing; if they were, Mr. PINTO believes his company would pay a dividend of 20 per cent. In the case of coffee plants it was four or five years before they got any return; but now that they are beginning to yield, he believes that within a year or two large profits will be reaped from the coffee plantation. The last time he was in Mexico he made a very careful examination of this plantation, and was extremely pleased with the progress that was being made. Touching upon the labour question, Mr. PINTO observed that a gentleman connected with a company which had property near them had expressed his surprise that they had been able to accomplish so much without Anglo-Saxon labour. They were working purely with Mexican labour, and intended to continue doing so, and he believed in a few years they would have as large a coffee crop as any plantation in Mexico.

It would seem from this that there is less nervousness in Mexico about the magnitude of Brazilian crops than is reflected in an article on "A Glut of Coffee," which we reproduce to-day from the *Madras Mail*. There is, we think, a great deal less cause for alarm than our contemporary makes out. It must always be remembered that where "Futures" are operated in, the 'bears' as well as the 'bulls' have a chance of an innings. It is to interest of the former to spread reports of abnormally l crops, and every such report should be received caution. It is unfortunately true that estimates of Braz Coffee crops are exceptionally unreliable. Still, fig regarding the past, at least, are available. Accordin the message of the President of the State of Rio de Jan the average coffee crop of the State from 1881 to 1895 been as follows :—

Between 1881 and 1885	...	..	131,572,011 kilos.
„ 1886 „ 1890	...	..	90,543,270 „
„ 1891 „ 1895	...	...	75,366,276 „

It would certainly appear from this that the time f recovery had come, and there is no reason for alarm if there are signs of such a recovery setting in. Besi current reports are, as usual, conflicting. One writer rem in a Rio paper :—"On Sunday week we overheard a Brazi gentleman remark that 'this rain will be worth a mil bags of coffee to the country.' How correct the propl may be we cannot say, but a drenching three days' rai September after a long drought cannot fail to be of greatest benefit to the coffee plantations. It should remembered that the first blossoms usually appear September." The allusion to a prolonged drought sh be noted by our Madras contemporary. Then, again, read in the Rio *News* :—"If there is a prospect of a fai of the next crop, as many planters allege, why not try effect of fertilizing and pruning? If the coffee trees exhausted by the heavy crops of the last two years, the trees should be carefully pruned as a means of centrating their strength and careful cultivation shoul employed to restore exhausted vitality." Great wits j together; and writers in India and in Brazil have la reminded us, almost in the same words, that Na herself revolts against over-production. So she does aga a vacuum, by the way; which suggests that she lik happy mean.

One more quotation concerning Brazilian crops. Rio *News* states :—"The great variation in the coffee cro Brazil shows that a continuation of mammoth crops is no be expected unless due to a very extensive increase in number of trees coming into bearing from year to y which is the case in Brazil. Now it seems possible that lack of foresight on the part of the planter the old co plantations are threatened with decay, and that m chronic disease and an easy prey to insect pests." We this quotation as received, though it does not appear to correct. At any rate, we read it as intended to reas the despondent believer in excessive crops, and as offe him some encouragement. There is some little relief als the thought that Tobacco is giving still better promise t Coffee in Mexico. If prices of the latter were higher, would probably not be the case, and thus there is a hid blessing in even the depression of prices. Nevertheless, not cheering to hear of sales at 28*s.* per cwt. of San Jamaica, and Ceylon Liberian. Here, too, however, the the consolation that the old high price of coffee in retail sh must disappear if prices such as the above become at all gen On this point, we concur with the *Madras Mail's* rema Present retail prices of Coffee in England are far too h but there is something to be said for those who continu charge thus. Prices of Coffee are extremely varia There is no guarantee that a heavy fall in, say, Octo

will not be followed by a sharp rise in January or February. Every shopkeeper knows that it is easier to reduce prices than to put them back to the old level. Retailers, therefore, will not drop prices until forced; but the competition that is needed to force them to do so has already begun, and if retailers' prices drop considerably there should be an increasing demand and a consequent reaction. It is pleasant to read at a critical time like this that there is talk of an amalgamation of Coffee houses. There is no doubt that with good management these, already numerous, might be increased in number, and in utility. It is when depression of prices is most marked that there is the greatest need of effort directed towards the development of demand. That there is also need of attention to the cost of production and of placing on the market is also certain. As regards Indian Tea we might urge that, to strengthen prices, planters should lessen cultivation, but this is scarcely the right course as regards Coffee, seeing how largely the prices of the Indian berry are influenced by those of Brazilian and other descriptions. It is a course that has already been adopted to some small extent, under the pressure of individual necessity; but it is very doubtful if the reduction of the area under Indian Coffee has had even the remotest influence upon the prices of the product. The best advice we can give our Coffee friends is—reduce cost to a minimum, get as much as you can out of your land, and combine with your fellow-planters to push consumption in old and new markets.

PROSPECTS FOR TEA.

The following extract from a letter from a South Indian planter, now in Europe, has been placed at our disposal. "Tea! Prospects? *Chi sa*? The statistical position is good, extension has stopped or nearly so, and I should not wonder if in a couple of years or so there were a good time for those who have been able to hold on: always provided there is a return to honest currency. It is said that English machinery has not improved China Tea: anyhow, the few machine-made teas from China in the market have found no favour with buyers, the tea being burned. It is further said that China leaf, owing to the distances it is carried before manufacture and so on, is not suited to English machinery. This, however, I doubt, and I expect China, as she is opened out, will improve her outturn." It is but fair to add that the writer terms the above remarks "purely speculative." That does not detract from their interest.

As for the bright future for those who are able to hold on, the above remarks lead us into a digression, as they remind us of something much stronger in a similar strain. This does not relate to a Tea or Coffee company, but it is the richest thing in directors' reports that has come in our way, and the above correspondent's forecast almost make us give it as a "purely speculative" and prophetic model for use by Tea Companies in the sweet by-and-bye. Here are extracts from the report:—"We started this half-year with nothing—we end it in debt; therefore it is a matter for congratulation that we have chosen a banker who will allow us a free leg. We think it necessary to sound a note of warning, however, and suggest very respectfully that it is advisable not to over-run the constable too much. *Verbum sat sapiente.*" "In conclusion," the report runs, "we beg to place on record our unbounded confidence in the company of which we are fortunate shareholders, and we verily believe our most sanguine expectations will be realised—in the sweet by-and-bye; that is, if your funds will only see us through. Your directors now retire from office, and, although they would scorn to make such a proposal on their own behalf, they would humbly suggest that the remuneration of the members of the board be fixed at a higher rate than during last term—say, at twice the sum. (The remuneration was *nil.*) Their duties are arduous and multifarious, and although all have not worked equally hard, the efforts made by some to shirk the responsibility fairly entitles them to their honorarium. In any case, we leave ourselves in your hands, trusting that you will handle us gently, for we are all reared as pets. We are too full to indite more, and subscribe ourselves, Your Directors." Here, again, we must add a postscript in justice to the framer of the above report. The Company—a mining Company in Australia—is now a prosperous and flourishing concern! "Those who have been able to hold on." "That "is, if your funds will only see us through." Australia and India side by side: the same sentiments in the new country as in the very old.

RUBBISH!

Is rubbishy tea to be dumped down in Persia or any other market that will take it, or is it to be cast into the fire? This question has been under discussion in Ceylon lately, and the end of the discussion has not yet been arrived at We might, however, point out that though Persia be a very useful dumping ground, it might be policy *not* to export rubbishy tea, for it must pass as *Indian* tea, if it is shipped from India. And when put on any market it must tend to make particular buyers think that Indian tea is of the lowest! Perhaps Ceylon might be left to play this little game alone, while India resorts to the incinerator or, if it be possible, the chemist's still. We have no means of arriving at the cost of manufacturing Caffeine from the most inferior sorts of Indian teas. If any of our readers can help us, we shall be very much obliged to him. There is no question as to the soundness of the general principle that a reduction of supplies tends towards an enhancement of values. Even the destruction of rubbish—so long as it is *called* 'Tea'—should have an influence on Tea prices; but whether that influence would not be a negligeable quantity is open to question. It may be remarked that Manchester calico printers have recently adopted a much more drastic course, based on a similar general principle. They have lately purchased the works of the Blanefield Printing Company, Limited, for about £20,000, and they propose to break up the machinery and re-let the premises for other purposes than printing. They also invite subscriptions from the trade to carry on this and other good works for the members' benefit. There is a hint here as to a new use for subscriptions raised by Indian Tea-planters! The mischief is that there is usually some enterprising outsider who will persist in smashing up an arrangement such as the above, by starting a new place on his own account; so that the latter end of that industry becomes worse than the former.

SIGNED CORRESPONDENCE.

[Under this head, letters, replies and remarks will only be admitted if signed by the writer. The object is to promote the interchange of opinions, experiences, etc., between planters who are willing to support their remarks with their signatures.]

MANURING.

SIR,—It is rather startling to be summoned by name in this manner to lay oneself open to criticism from the whole world by exposing utter ignorance of any subject, and it is a poor return you have made me for my most excellent suggestion. I did not mean that you were to round on me in this manner, but expected you to induce another victim to write something which I could criticise. Quite a different matter! However, I suppose you have kept evidence that I did make the suggestion, and it is no good trying to back out.

In spite of all, I suppose you may have the remnants of some sort of conscience left, and will therefore assume that you are ignorant of the enormity of the demand you have made upon me. If you are not and have done this thing in cold blood, you will probably refuse to print my opinion of you. You have demanded of me an exposition of my views on manuring—a subject which has more sides to it than I can at present enumerate and every one of which is capable of giving rise to the keenest controversy.

That such controversy, if aroused, may end in supplying me with some of the information I stand in so much need of is undeniable, and it is therefore best to accept your challenge and such hard words as may fall on my head in consequence.

There is probably no dispute of so great interest or so capable of affording grounds for argument as that between the old school of bulk manure men and the new school (if I may so designate a body of experienced planters) who give their faith absolutely to the more concentrated forms, and even call poonac a bulk manure, I believe. I personally, accepting theories on either side with great caution, have the matter more or less under active experiment, having given up some fields to the use of artificial manures alone (including poonac and lime, which are called artificials here), keeping the rest of the estate under the old combination of both kinds; and I think further of abandoning the use of artificials on one other field, though I may say at once that if I do it will be a small one, as I have little faith in cattle manure alone supplying all that is needed in all soils, and I do not mean in any case to exclude lime from such field, as the soil of this place, with the exception of one corner far removed from my cattlesheds, is very stiff and holds moisture longer than any place I know, and it appears to me that constant application of a heavy compost would be likely to result in sourness without the application of lime.

If I had jungle topsoil available, I would not have a head of cattle on the place, for if bulk manuring is required, I feel sure that the scrapings of even inferior scrub jungle are fully equal to the average cattle manure we produce by means of our own cattle or purchase from villagers. This is not an original theory of my own, it emanates from a far more experienced planter than myself, with whom I was at first inclined to disagree; but I have now satisfied myself, both by analysis and experiment, that, in a scheme of combination at all events, there is little to choose between them, except the matter of cost, which generally works out in favour of the soil and the nitrifying properties *alleged* to be possessed by fresh jungle soil and the denitrifying properties attributed in some quarters to fresh cattle manure. I should, however, have even less faith in soil alone than I have in cattle manure alone, except in quantities which might involve a prohibitive cost.

Unfortunately, this is a very small place and planted up to its boundaries, so if I want to use really bulky manures I n retain my cattle.

The experiments mentioned having only just commence cannot offer any opinion, but trust that the opening of the ject in your columns and my confessions of ignorance result in the collection of experiences from those who studied the matter longer and more carefully.

CATTLE MANURE.

To take cattle manure first, we must not lose sight of the yet disproved "denitrifying" scare. With such a demand nitrogen as exists in our trees, any process which results loss of that element would be most disastrous, and if the th is correct, the only saving clause apparent is that the actio said to grow less and less as time goes on, and probably bulk of our stuff is over six months' old before it is appl Has anyone tried experiments with a view to comparing effects of fresh and old manure, and, if so, will he let us kno he was able to arrive at any conclusion? I have never trie separate them, generally mixing the contents of all my together and adding all line sweepings and any other rub lying handy—at times including pulp, and at others omit it—but I have occasionally been pleased or disappointed by res not anticipated: the word "results" must be used in s matters with all reservation, for sometimes one hesitates definitely attribute to a certain change a certain cause.

There is another point very much in dispute, and that is length of time required for cattle manure to be digested by tree, and here again I have frequently been puzzled, having what were apparently immediate effects in some cases, whil others, without any ascertainable cause, they have been so delayed that it has remained very uncertain whether there really an appreciable result from that application.

If it be admitted that cattle manure does pay, the last p is of comparatively minor importance, but it perhaps invo the greater one of what time of the year is the best for appl tion. This has been much discussed, and considerably exp mented on. I myself have tried to come to a decision, with being able to do so. An apparently most decisive experin was forced on me last year by failure of coolies to turn up, if cattle manure becomes available in nine months has utt failed. I manured half a field in September-October, and t had to stop to get on with more urgent work, and did not c plete the manuring of that field till the hot weather carefully marked the dividing line, and from that time to have not been able to detect any difference.

Another point which should perhaps have come before is bed or not to bed." In this district it has been, I think, usua bed the cattle as much as possible, all kinds of materials b used,—straw, fern, dried leaves swept up from the jungles, ju soil, and green leaves and shoots, &c., cut in jungle or on g land and carried in to the sheds. Weeds are sometimes pu and I have not noticed any harmful effects on estates wh this is done.

Lately I have been considering whether this striving a bulk is remunerative; it is, as a rule, exceedingly costly takes out a large proportion of the labour at times when th may be much other work to do. It seems to me that we plant under shade secure in the leaf fall a large amoun humus which is mostly drawn up from a depth greater t that at which our coffee feeds, and if this is the case we wasting time and money in supplying a commodity which not be necessary. The chemical properties of bedding can more cheaply applied in a concentrated form; and very poss the application of smaller quantities of cattle manure pure supply all that is missing in the way of humus. I must sa with great distrust and hesitation, being quite ignorant chemistry, but it appears to me probable that the element wh

is chiefly supplied or chiefly sought for in beddings of all sorts in addition to the more mechanical bulk is potash. Does all the potash so supplied become available? We know that if all the potash now existent in most of our soils were available, it would last out several generations of planters, and yet we have every reason to believe that available potash is frequently much needed. Are we going to work in the right way in applying these costly substances to supply the deficiency? I think not. Mechanical bulk is no doubt the great thing sought for, and I have grave doubts now as to whether it is necessary to such a degree as to demand the heavy expenditure it undoubtedly involves.

Then, to continue the discussion of cattle manure, there are many differences of opinion as to the best method of application. In this I may say at once that when time, labour and the lay of land permit, the first way I ever tried seems to me the best. Have your manure in as fine a state as possible (spread it out thin and have it ploughed three or four times, a man with a good pair of buffaloes gets through a lot of manure), apply it from 18 inches or even 1 foot from the stem to the utmost spread of the branches and fork it in lightly without lifting the roots or soil.

This can only be done in the hot weather and with well-powdered manure, and there are two dangers to avoid. If the stuff be at all moist an undesirable impetus *may* be given to the bud, while if the forking be done too long before the showers in a dry place damage *may* be done by excessive dryage. Still in this, as in most things, the possession of a little of the faculty of *bandobast* will do great things. I do not like the pit system, though on very steep land, of which I have very little, an alternative is hard to find; if pits must be taken they should be at least 3 feet long 1 foot wide, and on steep land 1 foot deep. Manure should not be flung in and covered over, but carefully mixed with soil at the bottom of the trench and some of that taken out. This is such an expensive operation that most people naturally shrink from the cost. The system of flinging the manure down in the middle of four trees has the merit of cheapness, but I do not know if there are any other recommendations unless one wishes for further exposure to get rid of denitrifying influences, and even then I dare say the pernicious bacilli, if they do exist, find their way into the soil. The system of spreading the manure round the tree or over the ground with more or less care, but not digging it in, is perhaps a better one than the last, but I cannot help thinking that there must be considerable loss. I have done all these things, my application having been guided by circumstances, and while regarding cattle manure with suspicion on account of its costliness, I think that the more costly method which I was first taught is the best. It runs to nearly, if not quite, Rs.100 per acre, with a fairly honest basket to a tree (say $\frac{3}{4}$ bushel), which is an almost prohibitive sum to most, and it does worse, it takes a number of coolies off other works sufficient to cause inconvenience at times, and it necessarily leads to the prolonging of one's own labours, as without this operation imported coolies could probably be paid off a month earlier.

With all this I cannot make up my mind to abandon bulk altogether, but I welcome the hope given us by those I have called the new school, and am only too willing to experiment on their lines. I have received valuable information from one of them, and earnestly hope to receive more from critics of my remarks. No doubt I shall be made to regret having expressed any opinions, however mildly; but we have all heard many tales of communities being benefited by a human sacrifice, and I offer myself as a willing victim. Probably you, Sir High Priest, are beginning to wish that you had exercised a little more discretion in the choice of a subject. I have not finished yet, but there cannot be much more. My ignorance in the matter of cattle manuring may be called only comparative; with regard to artificials and especially chemicals it is absolute.

Jno. G. Hamilton.

Seagully, Mudigere,
5th October, 1898.

[As Mr. Hamilton, though he poses as a very unwilling victim at the outset, ends by asserting himself to be a willing one, we need offer no apologies for having given a turn of the boomerang to his suggestion and sent it back to its originator! It was the least we could do, as a mark of genuine appreciation of that suggestion, to ask Mr. Hamilton to give practical effect to it. If he does not feel all the better for having expressed his thoughts, many of our readers will at least be glad to read his remarks. We are glad to note that he "has not finished yet," but hope that there *will* be "much more."—Ed., *P.O.*]

NOTES.

Ceylon Tea Shipments. The shipments of tea from Ceylon last month are stated by the Colombo Chamber of Commerce at $6\frac{1}{2}$ million pounds. The estimate for November is $6\frac{3}{4}$ to $7\frac{1}{4}$ million pounds.

A Madras Appointment. The *Kew Bulletin* reports that Mr. C. A. Barber, lately Superindent of the Agricultural Department of the Leeward Islands, has been appointed Government botanist for the Madras Presidency in the room of the late Prof. Lawson.

Calcutta Tea Sales. At the sales in Calcutta on 3rd instant about 22,000 packages were sold. There was good competition at firmer rates. Pekoe Souchong kinds were distinctly dearer. Darjeelings were keenly competed for. Sylhet pekoes were in strong demand by Bombay buyers.

The Planters' Association of Ceylon. We have to acknowledge, with thanks, the receipt of a copy of the Proceedings of the Planters' Association of Ceylon for the year ending 17th February, 1898. It is a very bulky volume, and gives an immense amount of information on all manner of subjects connected with the planting interest. As usual, it is well arranged and neatly bound.

The Ceylon Cacao Cryptogamist. It was stated at the Committee meeting of the Haputale Planters' Association, on 29th ultimo, that Mr. Carruthers was unwilling to remain in the Island. It was resolved:—"That the Association support the action of the Parent Association in asking for the establishment of an Agricultural Department to include a qualified Cryptogamist."

The Tea Season up North. From Cachar it is reported that the season seems far from being a prolonged one. Native competition does not appear to be liked. In South Sylhet the outturn is not quite satisfactory, but some gardens have about reached estimates and a few have lopped them. A good many small estates are on the market. Very little tea is now being manufactured in Darjiling, and the season is practically closed.

London Dock Charges. The Coffee and Cocoa Section of the London Chamber of Commerce

has been considering the question of the charges of the London Dock Companies with respect to coffee and cocoa, which, it is alleged, are much higher than those ruling in some Continental and other ports. Representations will shortly be made to the Dock Companies with a view to inducing them to lower their charges, and thereby foster the trade in cocoa and coffee in London.

Effects of Cheap Tea. Mr. George Seton, of share-broking fame, says that he holds an opinion that is confirmed by many of those most closely in touch with distributors. This is, that it is the excessive cheapening of tea to the consumer which has been the great evil in spoiling and (if one may be allowed the expression) prostituting the trade in Great Britain, and that nothing would be better, alike for producers and distributors, than a gradual raising again of the standard of both quality and value.

Colombo Tea Sales. At the public sale of tea at the Chamber of Commerce room, Colombo, on 2nd instant, about 6,857 pkgs.=530,678 lbs. were offered, of which about 5,060 pkgs.=398,693 lbs. were sold. The sale passed with a very firm tone for all common teas. Medium and fine grades did not meet with such keen support. The best teas in the sale were: Queensland, Glasgow and Mocha. Amongst the low grown, some of the best were: Chesterford, Kelani, Talgaswella, Polatagama, and Eila.

Indigo. A Company has been formed in England under the title of the Indigo Defence Association, Limited, with a membership of 1,000, each liable for the sum of £1 in the event of winding up. The object of the Association is to promote and to protect the manufacture of indigo and the rights and interests of indigo planters in India and elsewhere. We mention the fact simply to show that the tea and coffee industries are not alone in their belief that self-defence, in these days of keen competition, must take an active form.

Curious Tea. The British and Colonial Tea Company of London have been distributing a circular in praise of their "Nontanine Tea." It is a bit of a curiosity, to judge from the description given by the Company:—"It is one of the most delicious and harmless teas ever offered to the public. It is a first crop tea of the finest quality; the leaves being picked *whilst the blossom is on the plant*, and it is as free fr tannin as, with our experience, it is possible to secur Evidently it is not only at *school* that sounder instruct is required with regard to tea.

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain per ton:—

61·50 lbs. Nitrogen.
57·38 „ Potash.
14·92 „ Lime.
13·68 „ Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the 1898-1899 crop of seed from the parent trees of above analysis at Rs.6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the

MANAGER, ARIENKOW ESTATE,
Shencottah.

Total Export of Tea from China. Messrs. Siemsseen and Co., in th Market Report, dated Hong-Ko 15th October, 1898, give the lowing figures:—

		SEASON. 1898–99. lbs.		1897–98. lbs.
To England	...	20,497,116	agst.	23,057,372
To the Continent	...	4,998,724	„	7,479,411
To Russia	...	22,035,577	„	24,545,404
To America	...	18,795,485	„	27,810,444
To Australia	...	4,515,185	„	3,513,458
To South Africa	...	1,289,058	„	1,257,944
Total	...	72,131,145	„	84,664,033

The London Tea Market. Telegraphic reports of 2 instant stated that the tone of market was firm. In their weekly telegram to Colom dated 3rd inst., Messrs. Gow, Wilson and Stanton sta that the market generally was unchanged, good liquori Broken Pekoes easier, poor liquoring teas steady. Quo tions—fair liquoring Ceylon Pekoe Souchong 6½*d.*; avera of Ceylon tea sold a Garden account during the week 8 Both these rates are the same as were quoted the previ week. Reuter reported on the same day that common medium Ceylon teas were in good demand; 24,000 packa were sold out of 25,000 offered, and the average was 8 (unchanged). As regards Indian, 50,000 packages w offered, of which 46,000 were sold, the average price bei 8⅜*d.* It is a long time since the average of Indian w quoted below that of Ceylon.

Imports of Artificial Manures into Ceylon. According to the Customs retur the imports of artificial manu into Ceylon in the last six years a as follows, the quantities imported being given in tons:—

	1891 Tons	1892 Tons	1893 Tons	1895 Tons	1896 Tons	1897 Tons
Manure, bone ...	4,287	4,046	3,734	4,343	4,904	5,075
Saltpetre, refuse ...	15	...	...	99	83	191
Castor-seed poonac ...	1,751	1,006	15,433	5,374	5,553	5,440
Fish manure ...	...	...	...	1,070	897	32
Manure chemical ...	...	...	...	...	136	...
Sulphate of ammonia..	26	...	...	...	...	125
Guano ...	...	7	5	...	...	4
Total ...	6,079	5,059	19,172	10,886	11,573	10,867

The figures do not point to any great increase in dema of late, but perhaps this is due more to general har up-ishness than to general disbelief in artificial manures.

Coffee Planting in New Guinea. It is reported that "Coffee pla ing is at last being undertaken earnest in New Guinea, as a plantati is being formed on the Astrolobe Mountains about 20 mi from Port Moresby, at an altitude of 2,500 feet, where it hoped to put about 30 acres under trees in February. T Hon. D. Ballantine is also starting a plantation a lit farther inland at Sogeri, and others are talking of taki up land for the same purpose. The coffee and tea alrea planted out are said to be looking splendid, as also t young plants in the nurseries. Liberian and Arabi

coffee has already been planted in several districts, and is everywhere doing well, but so far the Arabian variety has been neglected. On the Astrolobe it is intended to plant the latter kind only." "Any kind of soil or plant" and the pick of the country at 2/6*d.* per acre are special inducements no doubt, and it is even stated that the Government is contemplating the giving of blocks of land free of charge to *bonâ fide* settlers.

Tea in the Colonies. In their monthly report, dated October, 1898, Messrs. Alfred Harvey and Co., of Melbourne, give the following interesting statistics :—

TOTAL SHIPMENTS TO COLONIES.

Season.	Foochow. lbs.	H. Kong. lbs.	Colombo. lbs.	Calcutta. lbs.	Total. lbs.
1897-98	4,593,000	1,500,000	13,670,105	6,632,460	26,395,565
1896-97	6,200,000	1,500,000	11,793,882	6,197,450	25,691,332
1895-96	11,262,500	1,500,000	10,306,506	6,620,126	29,689,132

ARRIVALS AT MELBOURNE (COMPILED FROM CUSTOMS RETURNS).

	Foo-chow. lbs.	Hong Kong. lbs.	Colom-bo. lbs.	Cal-cutta. lbs.	Colo-nies. lbs.	Other Ports. lbs.	Total. lbs.
97-98	2,194,209	780,048	4,604,443	2,250,576	817,327	44,369	10,690,973
96-97	3,834,360	613,449	3,701,970	2,314,899	879,484	2,202	11,346,384
95-96	6,086,349	561,955	2,726,665	2,906,202	842,712	88,565	13,212,448

The advance of Ceylon is very marked, and equally so is the inactivity of Southern India—though probably Travancore teas are to some small extent included as Ceylon. The freight difficulty is in the way of progress for Southern India, and will continue to be so until planters bestir themselves to secure better and cheaper facilities than are now afforded them.

Analyses of Tea. The twenty-seventh annual report of the local Government Board shows that the report of the Commissioners of Customs is to the effect that their analyst under Section 30 of the Sale of Food and Drugs Act had analysed during the year 701 samples of imported teas before they were taken out of bond, as follows :—57 samples green tea faced, 9 green tea unfaced, 37 green tea caper, 303 black tea Congou, 259 black tea dust, 36 black tea siftings. Of this total 629 samples were, after analysis, considered satisfactory, and the importations represented by them were accordingly delivered on the certificates of the analyst. The remaining 72 samples represented teas of a doubtful character, the results of analysis of which were reported to the Board for their decision, with the following results :—71 samples, representing 1,085 packages, were refused admission to home consumption and restricted to exportation as being exhausted within the meaning of the Act, or as being mixed with other substances. One sample, representing 64 packages, was found to be unfit for human food and destroyed. Of the 403 samples of tea examined by public analysis in 1897 only one was found to be adulterated. As to this sample, which contained small stones and sand, the analyst for Derbyshire reports that at one time this method of increasing the weight of tea was not uncommon, but that since the Custom House authorities have undertaken the examination of tea when imported, it is extremely rare to meet with an adulterated sample.

LETTERS TO THE EDITOR.

POTATOES.

SIR,—Can you, or any of your readers, tell me how long a crop of potatoes should remain in the ground?

I have some that have just blossomed and are in splendid foliage. What I want to know is whether there is any indication, such as withering of leaf, etc., when the tubers are ready to be taken up? Also, what period generally elapses between sowing and reaping, and what is considered a fair yield per pound on the quantity put down?

BUSHMAN.

CITRIODORA.

SIR,—I should be glad if you, or any of your readers, could give me information about the above variety of gum.

It is, like all the eucalyptus family, a native of Australia, and is, I believe, being experimented with in this country in the interests of a projected secret industry. It is said to make a good shade tree, and it is in this particular that I seek information. Gums are not of a spreading habit, and give little shade for their size, but this variety appears to be little known, and may be of different conformation, so I should be glad to learn more of its nature and habits.

BUSHMAN.

FRUIT PESTS.

SIR,—My oranges, cucumbers, peaches and apples are attacked by maggots. I cannot say what the name of the fly is ; in fact there are two flies, one has diaphanous wings, and is very destructive to cucumbers and oranges, the other is a red fly which attacks peaches. I will look out for samples of each, and send them to you.

H. R. MORGAN.

OOTACAMUND,
5th November, 1898.

GENERAL ARTICLES.

TEA DRINKING IN LONDON.

"MIRANDA," in the *Lady's Pictorial* of the 15th October, has the following paragraph :—

There was a time when man—superior man—used to find the feminine love of tea a subject for mild jokelets. When he did not laugh at us for our predilection for the "cheering cup," he broke out in fierce tirades against it; and now he drinks it quite as freely as we do. Everybody is a tea-drinker, and at men's clubs it has become a favourite beverage, so that the hearts of the teetotallers should be rejoiced. On the contrary, however, dismay has spread in temperance circles at the announcement that tea-drinking is fast developing into a national vice. Women must come to the rescue and the kettle must advance to the drawing-room. Every hostess must make her own tea and see that it is brewed afresh for each batch of callers. With so eminent a tea-dealer as Sir John Voce Moore in the civic chair of the metropolis, and these words of warning in our ears, tea-making ought to become quite fashionable this winter. A woman always looks well when she is so engaged, and this is no small consideration.

COFFEE CROPS IN MYSORE.

THE *Ceylon Observer*, in republishing Mr. Graham Anderson's letter to us on this subject (*vide* issue of 22nd ultimo), remarked:—

The name of Mr. Graham Anderson has long been familiar to us as a Mysore planter of prolonged experience and a well-informed writer on planting topics. In answer to our enquiry as to the coffee crops of recent years as compared with ten years previously, he writes a long and interesting letter which we reproduce on our second page, but without exactly answering our question save in a general way. However, it is quite clear that Mysore coffee has never suffered from the leaf fungus to the degree that coffee in Ceylon did. But strangely enough, what we have always heard of as the chief cause of this comparative immunity, namely, shade-trees for the coffee, rich soil and a dry climate, are scarcely alluded to. Mr. Graham Anderson makes much of abnormal seasons; and, alas! this only serves to remind us of the voluminous writings on Tytler's dry and wet cycle, favourable and unfavourable seasons which began as coffee went back in Ceylon. Between 1840 and 1875 there were many "glorious seasons" because coffee was vigorous and capable of yielding good crops. After 1875 somehow, the seasons got out of joint all over the country, but it soon became evident the coffee was "out of joint" too. However, Mr. Anderson mentions one very significant fact, namely, that since certain Mysore estates *were replanted* with Nalknaad coffee, they have given better crops than ever before. We have no such experience in Ceylon. Nalknaad coffee seed was experimented with in one or two districts here, but without permanent success. A few catch crops were got, and then coffee gave way to cacao usually.

THE BRITISH TEA DUTY.

THE London correspondent of the *Times of Ceylon* writes under date 14th October, 1898:—

A meeting of the Tea and Produce Committee is to be held on Wednesday next. The business of the meeting is the nomination of three members to confer with three representatives of the Indian Tea Association (London), as to the proposed reduction or abolition of the home-duty on tea. It is on the initiative of the Indian people that this step is being taken, for here, we Ceylon men, are still awaiting news from the front, the decision of the Planters' Association in Ceylon. The opposition which, I understand, is preventing a settlement, exists also in London. There are in the ranks of the London tea-brokers—and well-known members also—some who look with very considerable doubt upon the policy of letting in the "rubbish" on still easier terms. But surely, all the teaching of the past goes to prove that this is a fallacy. The scare when the duty was last reduced is repeating itself. What is morally certain is this; increase the consumption, and the price will go up, rather than down, supplies being on the present basis, and owners of estates producing fine tea need still less be afraid of the 'bogey.' Any dealer you speak to will tell you of the difficulty he has in meeting his requirements in the matter of fine tea. To prove this, I need go no further than refer to the report of Messrs. Peek, Brothers and Winch, and the sentence I drew attention to in my letter of 16th September:—"We have again to report an excessive supply of common, and a great scarcity of fine tea from India and Ceylon." If your planters cannot fill the requirements of London dealers for fine tea, and continue to produce an excessive supply of common, they will assuredly best make an impression on this bulk by putting it more within the reach of working classes—by supporting solidly a reduction or abolition the British tea duty. The position of coffee to-day is worth consideration. Whilst the commoner sorts are far in excess of requirem the fine sorts remain unaffected; therefore, I repeat, producers of teas have nothing to fear.

INSECT PESTS IN HAWAII AND ELSEWHERE.

MR. E. E. GREEN writes that, since his visit to Ceylon, Mr. A Koebele has been busily employed in importing beneficial in from all parts of the world for the benefit of the Hawaiin plan He has even gone further, and pressed into his service bats toads, which were previously unknown in the islands. The l seem to have been successfully established, but the imported are said to have disappeared. Mr. Green proceeds:—I wonder Mr. Koebele has not tried moles. I have often thought that t little animals would be of great use in reducing the numbe underground insects, such as cockchafer grubs, wireworms, worms, and even white-ants. Their introduction would be unatte by any danger. Even in England the only harm they can be to do is that they spoil the neat appearance of the grass swar the numerous little hillocks of earth thrown up during their terranean wanderings in search of the grubs that feed upon the g roots. It is said that the wholesale destruction of moles in Eng has led to a serious increase in damage from underground la Mr. Koebele himself quotes an instance of the value of the mole. tells us that a gentleman of Yokohama, "in building a lawn cricket ground, had a brick wall surrounding this to a dept several feet to prevent the moles from injuring the lawn. All well for a few months, at the end of which the grass began to yellow and die off. All efforts with manure and water were use and he continuously found larvæ of Scarabæids (Cockchafers) had come to the surface to die. Nothing could be found to rem the evil until the gentleman was advised to take down the wall give the moles to the larvæ, which was done, and the lawn recovered."

Mr. Koebele may be called the "Apostle of Natural Remedi He altogether refuses to recommend artificial remedies, as b effective only for a short time and too expensive.

In view of the failure that so frequently attends the freezing cess, it would be interesting to learn what plan Mr. Koebele found most successful for the transportation of the numerous signments of lady-birds and other beneficial insects he has b procuring for the last three or four years.

THE FIRST FLUSH.

WHAT is the reason, asks the *Planter*, for the teas manufacture the commencement of each season being so poor in quality? heart of a cultivated tea-bush lies in the stem a foot below an foot above ground; we then have the taproot and other deep r which give the most sap, which sap, however, is very poor. next come to the branch and surface roots: these give the ri sap; both worked together send out to the branch leaves. leaves next do their share of the work by taking nourishment f the atmosphere, and ammonia from the soil through the cells in underpart of the leaf. During the dry months of the year the penetrates the soil, different soils, and makes the surface fee inactive. The deeper the heat gets the more roots get inactive: t get put to sleep, so to speak. The earth on the surface of the so baked and gives out no ammonia; the atmosphere is also d and dry, so the leaves also suffer; they droop and cannot sus themselves, much less help the flushing. Night-dew and sl showers enable them merely to look healthy. As the dry sea advances the bush gets more and more dependent on the tap lower roots, which now have to bear all the strain in supporting tree and give flushes. The sap given is, however, very poor, un the soil is rich at a great depth. The tea manufactured from poor flush is consequently weak in the cup. After the rain set the earth gets softened; the surface roots awaken from t

MILLIE & REDMOND, late P. THOMPSON & CO., *Ootacamund, Engineers and Contractors.*

dormant state and contribute their sap. The atmosphere is again moist, there is more or less electricity, and the earth gives up its ammonia. The leaves are now enabled to fulfil their functions. The total results of all these things working together are good healthy flushes, and consequently good manufactured tea.

Considering these things, do we act wisely in taking off our first flush when we do? Would it not he wisher on our part, especially when we consider the present state of the market, to sacrifice the first flush and let it remain on the bushes so as to give them some stamina. It is a moot question whether we prune our bushes at the right season. If next season orders were issued not to pluck the first flush, it would undoubtedly be a move in the right direction. Very few planters will question this, as the consensus of opinion now is that we start plucking too early, and that it would pay better in the long run to leave the leaf on the bushes.

COFFEE IN THE STRAITS SETTLEMENTS.

An *ex*-Ceylon Planter writes to the *Ceylon Observer*, under date 24th ultimo:—

Coffee beans which went down with the recent slump from $45 to about $16 per picul (133⅓lb.) has recovered slightly and is now in the neighbourhood of $23 for the best quality, and this is a price which would pay 15 to 20 per cent. on capital cost on estates in full bearing, *i.e.*, giving 5 to 6 piculs an acre. But some investors show signs of chucking their interests before giving their places a chance. The large majority, however, are sticking to their guns, and planting Para rubber and cocoanuts, in many cases through the coffee, sufficiently far apart to minimise the effect of the too dense shade. The discovery of tin on their totums has raised the hopes of a good many, and one estate which was once very nearly converted into a Company in Ceylon is said to have struck it pretty rich. The Government at one time were all for putting difficulties in the way of planters mining their land without first surrendering their agricultural titles, but our present Resident took up a strong position and helped us through. It is early to prophesy; but it is nevertheless quite on the cards that a good deal of land originally taken up for coffee may bring the proprietors in a considerable revenue from the tin, which is now quoted at the splendid price of $48 per picul (133⅓lb.) There can be no doubt that the country has a great agricultural future before it; for everything you plant grows luxuriantly, especially in the rich alluvial soil of the coast districts, almost all of which is reclaimed swamp land which ought to be a hotbed of fever and its attendant evils, but is on the contrary extraordinarily healthy, infinitely more so than the interior, where fever and dysentery in some localities, just about break one's heart.

Let us hope that Straits coffee-planters will have better luck with tin than Wynaad had with gold. In a country with "a great agricultural future before it," however, we should scarcely care to speculate much on coffee-planting combined with tin-mining on the same estate. If it is the tin that wins the race, what price that "great agricultural future?"

THE COFFEE PRODUCTION OF INDIA.

It is sincerely to be regretted that those who are responsible for the compilation of official trade statistics should fail to clearly recognise the demand on the part of the mercantile communities of all countries for not only complete but early information. Here, for example, are the official figures for the yield of coffee in India last year just arrived from Simla, as though it were the most inconsequential thing in the world whether they got to London at all. However, now that they have arrived we may endeavour to ascertain what they demonstrate.

The salient fact is that the yield in 1897—24,000,000 lb.—was 7·8 per cent. lower than in 1896, and also lower than that of every other year since 1885, with the solitary exception of 1890. Madras, it is true, registers a slight increase on 1896, but the total yield shows a considerable falling off. Madura, Tinnevelly, South Canara, and Malabar all suffered badly from a shortage of rain and leaf disease, and these are the two factors in the decline. Want of rain operated unfavourably in Mysore; but here something is to be attributed to a reduction in the area planted. The return throws very little light on the reasons which have led to a portion of the land going out of cultivation, but probably the depression in prices may be held mainly accountable for it, although the dying or removal of old plants, owing to their unproductiveness, also doubtless helped. The area under coffee in Madras has contracted greatly in the last two years, but outside of the districts of Malabar and the Nilgiris coffee is not grown to any large extent in the Presidency. The cultivation of the berry in India is, in fact, confined to the districts mentioned and to a limited zone in Mysore and Coorg. At the end of 1897 there were 276,074 acres of land under coffee, all, with the exception of 524 acres, in Southern India. The industry gives employment—taking the 1897 figures as a basis—for nearly 40,000 persons permanently and about 100,000 temporarily. The 1897 average is one employé to every 2·06 acres.

With regard to the matter of imports and exports, the following figures are the average for the five years ended 1897-98:—

Indian Coffee.	lb.	Foreign Coffee.	lb.
Production	...32,748,344	Imports	...1,361,024
Exports	...28,822,954	Re-exports	... 859,062
Left in India	... 3,925,390	Left in India	... 501,962

From these it will be seen that although India grows very much more coffee than she needs for her own use, she nevertheless imports a quantity. Of the coffee consumed in India, foreign coffee represents only about one-eighth the amount of Indian coffee. The figures also show that as much as 88·01 per cent. of the total production goes abroad. The principal consumers of 25,200,986 lb. of Indian coffee exported in 1897-98 were:—

	lb.		lb.
United Kingdom	...12,773,376	Austria-Hungary	...591,360
France	... 8,607,872	Germany	...297,584
Asiatic Turkey and Persia	... 863,856	Ceylon	...293,888
Arabia	... 630,896	Australia	...199,024

The United Kingdom is India's best customer, but France runs her comparatively close. The pronounced addiction of our friends the French to the use of the fragrant berry sufficiently explains this circumstance.

We have already intimated that the price of coffee is depressed. The following table of prices in London in February of each of the last twenty-three years gives point to the observation:—

	Per cwt.		Per cwt.
1876	...100s. to 116s.	1888	... 74s. to 95s.
1877	...107s. „ 122s.	1889	... 87s. „ 110s.
1878	... 96s. „ 122s.	1890	... 97s. „ 110s.
1879	... 91s. „ 112s.	1891	...102s. „ 115s.
1880	... 94s. „ 115s.	1892	...101s. „ 112s.
1881	... 75s. „ 108s.	1893	...105s. „ 118s.
1882	... 62s. „ 105s.	1894	... 94s. „ 109s.
1883	... 60s. „ 106s.	1895	... 96s. „ 112s.
1884	... 68s. „ 103s.	1896	... 95s. „ 110s.
1885	... 54s. „ 95s.	1897	... 98s „ 115s.
1886	... 54s. „ 105s.	1898	... 75s. „ 93s.
1887	... 75s. „ 95s.		

The ten years of depressed prices, 1879 to 1888, greatly discourged planting in India and Ceylon; but the sharp rise which took place in 1889 served to revive the drooping spirits of those engaged in the industry. Speculative corners, troubles in Brazil, and other causes have contributed to keep the level high since that year. In 1896 prices fell again, however, and, after improving again in 1897, fell very considerably lower in consequence, according to the return, "of the enormous quantities of Brazilian coffee which have been thrown on the market." The present position of the Indian planter can therefore hardly be described as comfortable. The best he can hope for is a speedy consumption of the Brazilian product now in stock. —*Financial News.*

JAVA QUININE.

Our contemporary, the *Chemist and Druggist*, deals with Mr. American Consul Everett's recent report in a sarcastic spirit. Though many of its remarks are but a repetition of information given in our columns some time ago, we quote the whole as follows:—

The future of Java cinchona need no longer trouble the producers. U.S. Consul Sidney B. Everett, of Batavia, has taken Java under his wing, and has told his Government how America can buy from Java

and be independent of Europe so far as "raw quinine" is concerned. Mr. F. W. Sijthoff, manager of the Java Quinine-factory, is Mr. Everett's authority for the statement; but if Mr. Everett's other information is derived from the same source, his prophecy must be taken cautiously, as he seems to be labouring under the impression that quinine is stuff worth a few pounds per ounce. "There have (he says) been invoice and shipped to U.S.A. from Java this year 48,300 oz. of sulphate of quinine, valued at $11,395,055," and "more will follow, of course, but not at that price." No American citizen is required to pay a dollar for his matutinal quinine-pill, although the "war has resulted in a rise in quinine quotations." Mr. Everett's figures have got mixed somehow; there are bound to be millions in it before a U.S. Consul dare touch a thing, and a paltry 48,300 oz. of quinine in face of "North America's annual consumption of 10,000,000 oz." was too little a thing to go by itself we fancy, especially as one object of the report seems to be to induce Americans to put their money in Java. We fancy, however, that Mr. Everett cannot be responsible for the $11,395,055. "Now is the time," he says, "to begin a new quinine-enterprise. The stock now laid up will be consumed in two or three years, and the demand will immediately be largely increased." (We may remark, parenthetically, that cinchona-trees are always growing.) He "cannot conceive of a better investment than the planting of cinchona in Java. Concessions of land are not hard to get there, if one is on the spot. The climate in the interior is as perfect as that of the coast cities is bad. The Dutch Government has made a great success of planting, clearing a profit in 1896 of over $38,500 from its estates. The world's output is only 788,771 lb., of which Java produces about three-fourths." The last sentence refers to quinine, not cinchona.

This invitation to American financiers is not altogether unreasonable, for the thing that Java cinchona-planters lack most is the wherewithal to prevent them realising bark as they dry it. They must get money—they must take what buyers give them for the bark. The successful attempt of last year to advance the unit (which increased threefold from January to December) resulted in such accumulation of bark that many have been forced to realise this year, the result being that, so far, a fourth more bark has been offered. This is shown by the following figures, which give the results of the auctions for the eight months of this year:—

Year.	Weight of Bark. Kilos.	Quinine Sulphate in Bark. Kilos.	Average per cent. of Quinine Sulphate.	Quinine Sulphate sold. Kilos.	Quinine Sulphate bought in Kilos.
1898 ...	5,175,316	257,678	4·88 to 5·43	178,539	79,139
1897 ...	4,005,504	221,058	5·26 „ 6·10	186,444	34,614
1896 ...	4,528,277	240,309	5·05 „ 5·83	202,126	38,183
1895 ...	4,636,859	225,367	4·63 „ 5·17	141,314	84,053
1894 ...	3,443,031	161,659	4·61 „ 5·12	125,727	35,932
1893 ...	3,930,594	172,982	4·23 „ 5·02	97,679	75,303

These sales also reveal the fact that this year's quality of bark has sensibly deteriorated—a condition which often accompanies deplantation, or indicates that carelessness on the part of the planters which results from unprofitable enterprise. However that may be, it is regrettable to see any sign of deterioration in a place where it is so easy to keep up the quality. These are considerations of practical utility to the American investor. It is astonishing how the consumption of quinine goes on. The above figures do not, perhaps, convey much, but when we say that at Amsterdam a fortnight since the bark sold represented 35 tons of quinine sulphate, and that one quinine-manufacturer bought two-thirds of it, everyone can grasp how important in volume the quinine-trade has become of recent years. It is also worth noting that although quinine is cheap, and the British Pharmacopœia has de-officialised cinchonidine, the latter alkaloid is growing in demand and is rapidly coming to the price of quinine.

Our chief reason for giving the above in full is that the *Ceylon Observer* has made it the text for a serious exhortation to Ceylon planters to try Cinchona again. This is how the matter is put:—

We would very seriously advise a renewed attempt at cinchona cultivation in Ceylon, especially in the Uva districts where plants did best and lived longest in years gone by. If fresh seed is got from Java or Northern India, there is no reason why both nursery and clearing—judiciously chosen—should not be successful; or it might be enough from the nursery to plant up all the bounda*aides* of roads and drains. A rather satirical, but still instruc*sriticism* of Java quinine and cinchona planting from the *Che*c*nd Druggist* winds up with the pregnant remark that "astonishing how the consumption of quinine goes on," and facts and figures in demonstration.

Moreover, our contemporary dwells on the great and gro demand which has set in for cinchonidine, which is rapidly r to the price of quinine. Now we have learned from Messrs. Bohri that Ceylon cinchona bark—what is left of it—excels in its propo of cinchonidine, and here is a new reason for once again exten the cultivation. We know what a disappointment the plant been to many in the past: but was not that due in many cas the use of local seed and hurried injudicious planting on expos badly-drained clearings. At any rate there is much to encou the planting up of boundaries and roadsides throughout the districts, Udapussellawa, Maturata and some other divisions w the plant did well in bygone times.

And so it always will be! As soon as the news travels round the price of a product is rising, men will set to work to try to share in the good thing, and the inevitable relapse in rates will fo

---

INDIAN TEA-GROWING PROSPECTS.

THE results of the 1897-98 season in this industry were uns factory. Working expenses rose owing to the famine, consequently increased cost of feeding the coolies. The qualit the yield was for the most part poor, the prices ruling in the Lo market showed a decline, and the exchange position was unsati tory, and many of the reports of individual companies refer t last cause as seriously affecting profits. The result of all this that dividends declined and the price of shares showed a consider fall. In the table given below it will be seen that even betw January 1898 and the present time there has been a marked de in quotations, though at the former time fears were entertaine to the season's results. Compared with an earlier date the fa price is even more marked.

Four months ago we indicated that prospects were improv and this view is confirmed by the reports coming to hand from principal districts. In Assam both quality and quanity are state be better than last year. In Dooars and Darjeeling the quanti about up to the average, while the quality is stated to show improvement. In Ceylon the quantity may be rather smaller, the quality, according to present indications, will be superior. least favourable accounts are received from Cachar and Sy where there was a drought up to August, so that at the pre time there is a shortage in the crop, and the quality is poor. F in these two districts, however, there is time for recovery if favour conditions prevail during the remainder of the season. It is als be borne in mind that the effects of the famine are over, and extra cost which it involved is not likely to recur this sea Prices are also better, and the development of trade with Austr North America, Russia, and elsewhere goes on satisfactorily. T is, therefore, fair reason to hope that the fears so freely expre some time ago as to production being in excess of consumption not be verified. The position with regard to exchange remain it was; but as there seems now a prospect that the rupee will re stable at about 1*s.* 4*d.*, there will be less uncertainty on this s than has hitherto prevailed.

The present moment, therefore, seems a favourable one considering an investment in this class of security. Below wi found a table setting out some of the principal companies, with districts in which their properties are situated, the dividends pai 1897, prices at various times during the present year, and the y per cent. at the present price on last year's dividend. The list tolerably comprehensive one, framed for giving a general idea o position, and it must not be assumed that all the shares menti are desirable. It may be noted that a good many of the Prefer shares give a yield of 5 per cent., and over, while the Ordi shares, of course more speculative, give in many cases consider higher rates of yield on last dividend result. Many of the r important companies in our list were dealt with in detail in issues of April 30 and May 28 last, to which we would refer readers. Speaking generally, the present time is one for judic buying, after careful consideration of the actual position of partic

concerns and of the prospects of appreciation of the shares; while existing holders of shares in promising companies will do well to retain their interests. Intending investors will find a great deal of useful information in the annual analytical table of the Indian companies issued by Mr. George Seton, of 120, Bishopsgate Street.

PRODUCE AND PLANTING.

TEA PROBLEMS. While all those who are interested in the tea industry are endeavouring to discover the cause of the present depression, the problem has been settled for them. Planters, as a rule, we know are of opinion that dear silver has a great deal to do with their troubles, and this opinion finds support in London where members of the tea community meet. It is admitted readily enough that cheap silver stimulated production, and that too much tea was in consequence rushed upon the market, but few tea proprietors would attribute the present state of things entirely to over-production. The Calcutta *Englishman* does not hesitate to do so, however. In one of its articles on the subject, after giving an array of figures in support of its contention, it says: "A careful examination of these figures shows to any student of the Currency Question that the fall in the price of tea has unquestionably throughout been entirely due to excessive production," and that this cause has had the same effect since the mints were closed as before, and that the reduced China export has played no part in the fall." There is no compromise here. Over-production and this alone has caused all the trouble, and dear silver is merely an incident of the position. The view taken by the *Englishman* is built upon facts and figures, but theories based even upon this apparently solid foundation have sometimes gone wrong. No one, so far as we are aware, wishes to minimise the evil of over-production, but it is possible to make a fetish of figures. As a writer in *Capital* points out: "The planters must know where the exchange shoe pinches them, and as tea is practically all export, and foreign markets other than the existing ones are still to be captured, surely it is easy enough to understand that planters should chafe a little under this 'talk of over-production,' when they know that an artificially raised standard allows them little chance of meeting outside competitors on anything like equal terms."

JAVA COFFEE PLANTING INTEREST. From a circular issued by the Netherlands India Agricultural Company to the 6¼ per cent. bond-holders, it would appear that the Dutch India coffee growing industry is not so prosperous as might be desired. The directors say that the April interest could not be paid to the bond-holders referred to owing to the necessity of keeping the available cash to maintain the good condition of the undertakings and to pay interest and redemption of the mortgage debt. If the cultivation is not satisfactorily cared for, the value would rapidly decrease, and the estates might be ruined. A reasonable bid in that case could scarcely be expected. Provisionally there is no prospect of a reinforcement of means. The 1898 coffee crop has not realised much, and it has now been proved that even the most moderate estimates have not by a long way been equalled. As regards the 1899 crop no reliable estimate can be given as yet. On September 4 a wire was received that the crop was estimated at 4,500 piculs, but the result of the months September and October must be known before anything definite can be said.

THE INDIAN CURRENCY COMMITTEE. The feeling in Calcutta appears to be against any speedy issue of a final report and recommendations by the Committee on Indian Currency, which is about to resume its inquiries in London. According to the Calcutta correspondent of the Allahabad *Pioneer*, it is felt perhaps even more since the publication of the first part of the "Minutes of Evidence" than before that the whole question is so difficult and intricate that any premature action taken which did not prove successful might be fraught with the gravest danger not only to commerce but to the State.

THOSE DOCK CHARGES. The Coffee and Cocoa Section of the London Chamber of Commerce has been considering the question of the charges of the London Dock Companies with respect to coffee and cocoa, which, it is alleged, are much higher than those ruling in some Continental and other ports. Representations will shortly be made to the Dock Companies with a view to inducing them to lower their charges, and thereby foster the trade in cocoa and coffee in London.

THE FLORIDA BEAN. Some valuable information is given in the *Kew Bulletin* about a leguminous plant known as the Florida bean, which has been prominently recommended in American journals as a forage plant, and as admirably adapted for green crop manuring. Recently the beans have been offered for sale in this country. The *Kew Bulletin* places on record what is known of the plant and its capabilities. As to its identity, it was from the first conjectured that the seeds belonged to a plant very near the common purple-flowered Cowhage or Cow-itch plant of the tropics "Mucuna pruriens." The difficulty, in the absence of adequate specimens, in identifying it with this was the fact that in the Cow-itch plant the pods are densely covered with stinging hairs of a brownish colour. A plant so formidably armed, it was thought, could not safely be recommended for general cultivation. In these circumstances we are glad to find from the *Queensland Agricultural Journal* that the plant has flowered and fruited in that colony, and that Mr. F. M. Bailey, the Colonial Botanist, has identified it as Mucuna pruriens, var. utilis. In this variety of the Cow-itch plant the pods are apparently devoid of stinging hairs. What may also prove to be the same plant, with jet black seeds, is cultivated as a rotation crop on sugar estates in Mauritius, under the name of "Pois Mascate." The accounts given by interested parties in America respecting the agricultural value of the Florida velvet bean must be received with caution. It is undoubtedly a rapid grower and affords a large yield of nutritious forage. It bears an abundant crop of seed and is therefore readily propagated. It may also, in common with many other leguminous plants, possess the power of obtaining its nitrogen from the atmosphere, and thus be admirably adapted for green crop manuring. How far it may be found superior in these respects to other plants it is impossible to say. As it is now

being carefully tested in various parts of the tropics, it would be well to await reports, which will, no doubt, be shortly issued on the subject. Meanwhile it may be useful to mention some of the more prominent leguminous plants that have long been used in tropical countries, both eastern and western, as rotation crops for fodder and green manuring: (1) Vigna Cataing, the Chowlee of India, the Tow Cok of China and the Cow pea of the West Indies; of this there are several varieties with black and clay-coloured seeds; (2) Cajanus indicus, the pigeon pea (the small form is known as the No-eye pea and the large as Congo pea); this is universally grown in St. Kitts and elsewhere in the West Indies as a "green dressing" on sugar estates; (3) Phaseolus lunatus, the sugar or Lima bean known in Mauritius as "Pois d'achéry;" "it remains on the land for three years and produces large crops of fodder." The ripe beans are, however, regarded as poisonous; (4) Dolichos lablab, the Madagascar or Lablab bean, this is known in Mauritius as the "Antaque"; (5) Dolichos purpureus, probably a variety of the latter known in Queensland as the Poor Man's bean; (6) Phaseolus Mungo, the green gram of India, known in Barbados as "Woolly Pyroe." This is planted "after the canes are reaped and afterwards turned in as a green dressing."—*H. & C. Mail.*

HOW TO MAKE TEA PAY.

"SIROCCO" has now divested himself of his *nom-de-plume*, and as plain "A. Cooke" has addressed the *Planter* on the above subject. First he gives his own experience, thus:—

The district is Chota Nagpur, which has been during its whole existence as a tea district at the very bottom of the list, both in area of tea and average prices.

The average rainfall is 56 inches, and every alternate year since 1890 there has been a drought. By drought I mean less than two inches of rain in eight months (from end September to end May). The bushes begin to flush in March, and if rain comes they continue to yield good flushes till the end of April. May is invariably a hot dry month, and the bushes dry up and take a rest until the rains come. This is the period in which we prune. As it would be bad for quantity if all the bushes were pruned, we prune only half the garden and let the other half remain unpruned.

I mention all this to show how much more favourable for tea all the other Indian districts must be. And I argued from this that close plucking must be less harmful to tea bushes in other districts. This encouraged me to write to the papers and see whether the idea would do any good. I have thought much about it, and my last idea is that perhaps the double rest, *i.e.*, in the cold weather, and again in May, may possibly make our bushes more hardy, and able to stand hard plucking. Also the fact that we prune only once in two years may give the bushes stronger wood.

Comparing our treatment of the bush with that of Assam, &c., we take off in leaf, and prunings in two years, about the same weight as the other districts take off in one year.

All this may help to prove that close plucking may pay here, and yet be fatal in other districts. However, other districts may find it profitable to abandon their fixed "dasturs" or prejudices, and adopt part of our system. I do not think that a poor soil garden will be able to stand the strain of close plucking and annual pruning, but I think that it might be made to do it by liberal manuring; or by reducing the pruning it may be able to give better results than it does under the old and prejudiced systems which have been proved unsatisfactory.

I have not the slightest wish that any one should adopt my ideas; I offer my experience, and hope that others will do as much to help those whom we know to be in trouble,—that is to say the managers of gardens which do not pay. I have been in Cachar, Sylhet, Assam, Chota Nagpur (in the order given); eight years here and the rest in the plains. Last year I went to the Kangra Valley, and I found still another system of treatment which would absolutely horrify any Assam planter. Firstly, the bushes are heavily pruned at long intervals (from five to ten years) leaving nothing but old "half inch" wood. This pruning is done in May-June before the rains begin. A good growth is left, *i.e.*, three or four leaves, after that close plucking is continued to the end of the year (end of October). In January the new growth is pruned; one leaf is left the first picking, and after that the shoots are close plucked to the end of the year. And so on, each January the three or four inches of growth is pruned off. Some gardens do not even leave one leaf to start with, but pluck close through. I was in the Kangra Valley only two days, so I leave a fuller description of systems to some Kangra planter. I have with me an average branch (off a good garden) whic been pruned off in June, 1897, after five years' growth, and the growth in that time was well under six inches. The neare proach to a simile which I can give is that it looks like a bit tak the top of a furge bush. The branch is one-half inch diar There are five branches on it, and I counted that 53 shoots had plucked off it in 1897 from January to June. I was shown on of tea which had not been hard pruned for 12 years, and close pl all the time. It was a show plot. And thus, with my experie Chota Nagpur and my glimpse of Kangra I thought tha systems might be of value to the plains gardens, especially to which do not pay under present conditions of prices, labour su &c. I advance it as an axiom that only fine leaf tea will pay I offer my experience of the methods by which more fine lea be obtained.

I should imagine that the powers of a tea bush depend on—

1. The quality of the soil, including cultivation.
2. The amount taken off the bush in leaf and wood.
3. The annual rainfall.
4. The periods of rest given to the bush.

Roughly, I would tabulate these as follows:—

Dooars ... } Assam ... }	2	5	2½	1
Cachar ... } Sylhet, &c. ... }	1¾	4	2½	1
Kangra ...	1½	1	1½	1½
Chota Nagpur	1	2	1	2

All these varying conditions may prove to be the reason why district has its own "dasturs" or prejudices. But even so quite possible that each district may take lessons from the ot because the conditions of tea selling have changed. Formerly prime object was to get the greatest *quantity* of leaf. Now ou object must be to get the greatest yield of absolutely *fine* leaf.

To revert to the above table of conditions Col. 2. The an taken off the bushes.

Assam takes 5 mds. tea and 20 inches of prunings each Kangra takes 4 mds. tea and 4 inches of prunings each year; Nagpur takes 4 mds. tea and 15 inches of prunings in *two* Assam and other planters will see how much more they take o bush than we do in Chota Nagpur, and if they wish to do b than at present, I would tell them to take more leaf and less p ings off their bushes. That is to say, not to allow the bush to too much, and to lessen the strain by giving up one pruning. system has also another good feature. The unpruned bushes lots of leaf at the beginning of the year, and if only half the ga is pruned, it will be found that the yield is more evenly distrib over the eight months from 1st February to end of October, and the fine leaf obviates all the difficulties of manufacture.

The chief reason why coarse plucking makes bad tea is tha fine leaf goes bad before the bigger leaves are ready to be made tea, especially in wet weather, or with leaf that has to be artific withered. One can easily imagine the harm done to coarse or dium leaf, of which the fine part is injured beyond repair. C and fine leaf plucked separately would give good results, but b results would be obtained by taking only fine leaf. If the ga cannot give enough fine leaf to occupy the labour, then part o labour and consequent supervision, housing, &c., must be give or the yield must be increased by manuring. The main poi this discussion is this: With the present market is it better to p round in four days, or in ten days, or any intermediate interval give my decision that four days on the best estates with the big labour force is the best; and for average estates with average la five days is the best interval. If you go beyond five days the l overgrown. If you cannot get all the leaf off in five days, it is b to leave a portion of the leaf to get overgrown than to have all leaf overgrown.

A GLUT OF COFFEE.

IT was generally supposed ten years ago that the uncondit manumission of slave labourers in the Republic of the United S of Brazil would inflict a crushing blow on the local coffee ind

PEIRCE, LESLIE & CO.

CALICUT, COCHIN, TELLICHERRY, MANGALORE.

LONDON OFFICE:— 14, BILLITER STREET, E.C.

CALICUT PRICE LIST
OF
ESTATE REQUISITES AND MANURES.

N.B.—We are prepared to indent home for any and all kinds of estate requirements not kept in stock or enumerated in this list.

ESTATE TOOLS—	Rs.	A.	P.
Round Eye Felling Axes (steel), 4 lbs. weight per doz. ...	20	4	0
Do. do. do. 2½ „ „ „ ...	15	0	0
Pick Axes, 6½ lbs. (well steeled) ... ... „ ...	16	8	0
Bill Hooks, (Barcutties) 12″ blade, bright steel „ ...	18	0	0
Do. Kentish, with back, steel, 2¼ lbs. wt. „ ...	16	0	0
Bushel Measures (Galvanized), Imperial Stnd. ...each ...	15	0	0
Watering Cans, (Galvanized) "Nonsuch," 2½ gals. each...	4	8	0

LUBRICATING OIL FOR OIL ENGINES:—
A blend of the finest and best oils.
In drums of 5 Imperial gallons ... ... per drum ... 15 0 0

PERMANGANATE OF POTASH ... ... per lb. ... 1 6 0
Used by the Medical Authorities for purifying wells, drinking water, etc.

MANURES.

Fish Guano. **Steamed Bone Meal.** **Poonac**:—Castor, Mowra, Hoongay. **Saltpetre, Crude and Refined** (Nitrate of Potash.) **itrate of Soda.** **Sulphate of Ammonia.** **Sulphate of Potash.** **Muriate of Potash.** **Superphosphates.** **Phosphate Powder.** **Kainits Salts.**

Mixtures can be made in any proportion without extra charge. **Packing** can be done to suit transport by bullocks, etc.

Prices will be furnished on application for delivery either at our Karaparumba Works, Calicut, the Calicut Railway Station, Palghat, Mettapollium, lem, or at our godowns in Cochin, Tellicherry, Mangalore and other places.

Quotations will be obtained and orders booked for any Manures not kept in stock. F.r.m.

from which it would be slow to recover; and it was naturally concluded that as the "visible supply" of coffee would fall off greatly, the price of coffee all the world over would advance to an unprecedented level, to the great advantage of planters in India, Ceylon, and elsewhere. And for a time these anticipations were verified. The want of labour on the coffee estates in Brazil was serious; the quantity of coffee that was placed on the market fell off greatly; and prices rose by leaps and bounds. From 1879 to 1888 prices had been much depressed, and what with the ravages of the borer and leaf disease, many planters in India and Ceylon grew weary of the hopeless struggle against misfortune, and either retired altogether from the scene, or uprooted their coffee bushes and placed their land under tea. But in 1889 prices began to mend, and in 1891, 1892, and 1893 they ranged at about 40 per cent. higher than the average between 1882 and 1886, and 25 per cent. higher than the average between 1887 and 1889. This upward movement accounts to a great extent for the recovery of the productive energy of Brazil being more rapid than was expected. The planters, feeling that they could place no reliance on free negro labour, offered the requisite inducement to immigrants from congested labour centres in Italy, and thus rapidly substituted efficient white labour for the unsatisfactory labour of emancipated slaves. With the improvement in the character aud capabilities of the labour employed there was an improvement also in methods of cultivation, and estates became more fruitful. High prices in Europe stimulated the extension of planting, large estates became larger, and new estates were opened out on land previously employed in the raising of maize, beans, cassava-root, and other food staples.

The effect on the shipments of coffee soon became manifest, and in the last three years it has been startling. According to Messrs. G. Duuring and Zoons, who are great authorities on the subject, the arrivals of coffee from Brazil in Europe and the United States, the deliveries, stocks, and supply were as follows in the first nine months of the last four years :—

	1895.	1896.	1897.	1898.
	tons.	tons.	tons.	tons.
Arrivals—Europe	314,420	289,210	369,656	406,630
U. S.	206,585	183,702	242,938	271,173
Deliveries—Europe	294,920	306,860	333,100	371,460
Stocks—Europe 1st Oct.	88,650	32,950	135,300	205,050
U. S. „ „	29,647	19,411	42,058	63,180
World's visible supply 1st Oct. ...	194,440	219,300	354,270	402,800

Another authority states that the receipts of coffee in the United States and Europe from Santos and Rio in the twelve months ending June, 1898, were 10,444,000 bags, as compared with 8,655,000 bags in the corresponding period of 1896-97 and 6,480,000 bags in the same period of 1895-96. This shows an increase of no less than 4 million bags, or about 62 per cent., in the short period of three years. And it is now anticipated that the supply in 1898-99 will be much in excess of that in 1897-98. Already the warehouses in London, Hamburg, Havre, and other great centres of the trade are full to overflowing with Brazilian coffee, so much so that last month the London Chamber of Commerce was negotiating with the Customs authorities for the provision of more accommodation. The consumption of coffee has not by any means progressed in proportion to the increase of the supply. Middlemen continue to hamper the trade by weighting the staple with their excessive profits, and retail dealers continue to ask 1*s.* 6*d.* to 1*s.* 10*d.* per pound for coffee that is intrinsically worth, perhaps, if the retail price were properly affected by the wholesale rate, barely a shilling. What, then, is to become of the enormous accumulation of stocks in both the United States and in Europe, or what is to become of market prices for an article that is being obviously supplied in excess of the world's requirements?

It is difficult to obtain official information about the extent of coffee planting in Brazil, and British Consuls and Vice-Consuls need stirring up; but some idea may be formed of the magnitude of the enterprise when we mention that the largest coffee estate in the country was sold about eighteen months ago to an English syndicate by the Companhia Agricola Fazenda Dumont for the sum of £1,200,000. The property extends to 110,000 acres, of which 13,000 acres are already planted, and 20,000 acres more are still available for planting with coffee. The rest of the land is suitable for the cultivation of maize, tobacco, sugar, &c. There are 6,500 labourers, almost all of whom are immigrants from Italy. They are formed into twenty-five "colonies", each containing twenty-five houses. They draw in wages $200,000 a year. There is a small number of negroes who once were a part of the slave contingent. The number of coffee trees in bearing advanced from 1,300,000 in 1 2,476,000 in 1896; the yield increased nearly threefold, a profit rose from $269,000 to $711,000. The total number of trees of various ages growing on the estate is 4½ millions next largest estate in Brazil has an area of 9,785 acres, has 1,8 coffee trees in bearing, and gives employment to 1,500 lab domiciled in nine "colonies." There are said to be several plantations on each of which more than a million coffee tr bearing are to be found.

With regard to India it appears from the memorandum drawn up by the Director-General of Statistics at Simla that t of land under coffee was 276,074 acres in 1897 as compare 289,266 acres in 1896 and 237,494 acres in 1885. There are acres under coffee in Madras, 125,876 acres in Mysore, 86,15 in Coorg, and 7,624 acres in Travancore and Cochin. There contraction of area in Madras of about 8,000 acres in the last years, and in Mysore of 16,000 acres in the last two years; t total contraction was inconsiderable, for it amounted to only acres in the last two years. Previous to 1894 the total area coffee had not reached the present area. So far, then, as r the extent of land under cultivation no great change has yet place. But this cannot be said in respect to the yield, for w the yield in 1885, in all India, was nearly 35 million lbs., i upwards of 38 million, and in 1895 upwards of 40 million, in was 26 million, and in 1897 barely 24 million. The yield in M Tinnevelly, South Canara, Malabar and the Nilgiris underw diminution, for in the last four years it was considerably in of the yield in the immediately preceding three years—the average in the former period being 11⅕ million lbs. and in the 8 7/10 million lbs. But in Mysore the yield last year was not more than 4½ million lbs., or only a half what it was in 1896; a what it was in 1895, and little more than a fifth what it was i In Coorg the yield last year was 7 million lbs. as against 5 mi 1896, and nearly 11 million in 1895 In Travancore and Coch yield was similarly 477,843 lbs. as against 333,732 lbs. and 1,3 lbs. The contraction of the yield is partly attributable to th of rain; but falling prices and unremunerative markets have ex a most depressing influence on production.

Taking the number 100 to represent both area and produc 1885, it is found that in 1897 the area had increased in the r 116, but the production had declined in the ratio of 69. The estates in India give employment to 433,639 persons (of whom are permanently and 95,820 are temporarily employed), w equal to one person per 2·06 acres. 88 per cent. of the coffe duced is exported. Of the 28⅘ million lbs. exported in 1897- United Kingdom took about 12¾ million lbs., France 8⅘ m Asiatic Turkey, Persia, and Arabia nearly 1⅕ million lbs. (c perhaps, for conversion into so-called "Arabian" or "Mocha" Austria and Germany about 800,000 lbs., &c. The outlook for planters in India—what with the artificial rate of exchange, a glut of Brazil coffee in the markets—is not a cheerful one; may be remembered that when a few years ago Ceylon was threa with ruin by the great decline in coffee, she found salvation Of course too much tea can be produced, just as well as too coffee, but in the long run production in excess of consumption out its own cure.—*Madras Mail.*

NOW UP AND NOW DOWN.

NOTICE the slender column of mercury in your thermometer day it is longer than it was yesterday; to-morrow it may be still, much shorter; you can't tell in advance. So it varies wi amount of heat in the atmosphere. Very good; but we all that before you say.

Take note of another measuring instrument, then; one tha carry about whithersoever you go. We often hear one person another, "His spirits are very mercurial," meaning that they fall under slight influence. But others have protracted peri depression of sprits, sometimes threatening permanent melan In fact, instances of this kind are getting to be alarmingly co and any suggestions as to the cause and the remedy must be w to society at large.

Speaking of a recent illness of her own, Mrs. Hagar P says the doctor pronounced her ailment to be "nervous deb The phrase is familiar and expressive; and the doctor used it ordinarily accepted sense. After all we seem to need more

Perhaps we shall get it by turning a leaf backward and finding out how the trouble began.

"In July, 1889," says the lady, "I felt strangely weak and out of spirits. I could scarcely persuade myself to eat anything, and when I did the food caused me much distress in the stomach and pain in the chest. Neither did I get any strength from it, but grew more weak and nervous. Later on I had frequent attacks of dizziness and fainting fits, which would come upon me in the street, so that I often came near falling to the ground. Sometimes I had two or three such attacks in a single day. The doctor said I had nervous debility, but the medicine he gave me did no good.

"Better and worse I suffered in this manner for about three years, no treatment availing to relieve me. At Easter of 1892 my mother brought me a bottle of medicine of the same kind that had cured her of liver-complaint. I began using it, and in a short time I could eat better and my food digested without giving me any trouble or discomfort. I grew stronger, the fainting fits gradually ceased, and I regained my health. (Signed) Hagar Percival, 25, Lind Street, County Road, Walton, Liverpool, July 19th, 1893."

In a letter dated November 30th, 1892, and written at his home, 142, Shepherd's Bush Road, London, W., a correspondent states that in the year 1883 he fell into a condition of nervous debility. He took medicines in plenty, but grew worse and worse notwithstanding. The early peculiarities of his case were exactly the same as in the case of Mrs. Percival above named.

"One day," he declares, "a friend of mine, Mr. Charles Swan, of King's street, told me of a medicine from the use of which his sister had derived great benefit under like circumstances. I had once began taking it, and before I had finished one bottle the pain and distress left me, my nerves were steady, and I gained strength. After I had used three bottles I was in as good health as I was before the attack the previous spring. Appreciating the value of a remedy which proved able to do what no other could accomplish, I am perfectly willing to have the fact made public. (Signed) Frank William Deacon."

The nervous depression in both these cases, as in most others, was the direct consequence of the circulation of impurities of the blood The extreme melancholy and distortion of judgment witnessed in hypochondriacs arises from the same cause; and (*this point is for your memory*) the cause underlying all, is indigestion and dyspepsia, which creates these impurities in the stomach and scatters them through the system.

To have strong nerves we must have pure blood; to have pure blood we must have perfect digestion, and to have *that* we must do what these two people did, use Mother Seigel's Curative Syrup. They used it as soon as they heard of it. Warned by their needless suffering *you* will use it the moment you feel the first symptoms of the coming evil.

MARKET REPORT.

COFFEE.

Messrs. Wm. Jas. & Hy. Thompson's Report of the Colonial Markets for the Week ending October 19th, 1898, says :—Bank rate 4%, Bombay Exchange closes at 1s $3\frac{1}{16}$d. Brazil Exchange $8\frac{7}{32}$d. Rupee paper $3\frac{1}{2}$% $62\frac{3}{8}$. Silver $27\frac{11}{16}$d per oz.

We have no change to report in this market; good and fine qualities continue to sell well, but ordinary and common are again lower. Further supplies of Guatemala have met with a poor demand, being mostly bought in. Brazil markets continue flat.

At the Dutch sale held yesterday in Rotterdam, 21,090 bags 21 cases Java were offered and sold at irregular prices, mostly 1 to 4 cents below valuations, good ordinary Java selling at 34 cents, againtst 35½ cents in September.

Futures have remained dull, closing prices showing a decline of about 3d per cwt., viz. :—Good average Santos in Havre, December delivery, fcs. 37.25, in Hamburg pf. 31, and No. 7 low ordinary Rio in New York $5.45.

Daily receipts averaged 10,000 bags in Rio, and 22,300 bags in Santos.

Prices realized at auction for the principal Marks of East India :—

OIL PAINTINGS, and Crayon Drawings unsurpassed.

Out-door Photography at a moment's notice.

PHOTOGRAPHS of moving objects, such as horses in action, Ladies and Gentlemen riding their bicycles, &c., always successful.

Picture Framing in good Taste and First Class Workmanship.

VIEWS OF SOUTHERN INDIA.

Terms Moderate. MR. E. F. H. WIELE conducts his Studio personally.

[w. 15-10-98—14-1-99.]

The market continues very dull and the general quality of the supplies offered during the week has not conduced to any improvement in the demand. Ceylon sold at relatively high figures. The bulk of the quantity brought to auction consisted of Central American, which were only partly sold, whilst Vera Paz was very firmly held and nearly all withdrawn. Colombian was the only growth which attracted attention and high prices were obtained for bold well picked, inferior grades on the other hand going cheaper. In the market for "futures," quietness has generally prevailed with rather easier prices, but closing firmly at the decline, viz. :—

London	...Santos	...December	delivery	... 30s. 3d.
New York	...No. 7 Rio	... „	„	... 5·45 cents.
Hamburg	...Santos	... „	„	... 31 pf.
Havre	...Santos	... „	„	... 37½ francs.
Holland	...Good ordinary Java	...		... 34 cents.

At the Dutch Trading Company's auction on Tuesday of 21,090 bags 21 cases, held in Rotterdam, irregular prices were realised, mostly 1c to 4c below valuations, good ordinary Java, valued at 35c, selling at 34c, as against 35½c in September.

TEA.

The *Commercial Record* of 21st ultimo says :—

CHINA.—The few sales recorded privately during the week include good Ningchow at 9d to 10d per lb. for export, but the market generally is extremely quiet. Public sales since our last have offered 5,248 pkgs. which were partly disposed of, Green Teas meeting the most enquiry.

INDIAN.—The amount offered was about on a par with last week, viz., 48,300 packages, against 48,900 packages, and 45,900 packages for the corresponding period a year ago.

There was again a brisk demand, and previous rates were about maintained for all desirable liquoring parcels, although as is usually the case irregularity was at times noticeable, chiefly in Broken Pekoes. Quality on the whole continues useful, some of the Dooars invoices possessing better flavour, while Cachars and Sylhets occasionally mark a slight improvement. Bidding for the most part was concentrated on Teas with good cup, but common to fair Pekoe Souchongs also received more attention than of late. Pekoes from 7d to 9d per lb. are still comparatively cheap.

For 34,300 packages on Estate account 8¼d per lb. was obtained, *versus* 9¼d per lb. for 31,800 packages, and 9⅜d per lb. for 27,300 packages in the two foregoing seasons.

CEYLON.—Larger supplies were brought forward aggregating 24,500 packages, opposed to 12,900 packages on the 11th inst. and 19,100 packages at this date in the preceding year.

Competition was somewhat more general and prices were firm for nearly all descriptions, with an upward tendency for the most attractive lines. Common to good leafy kinds were steady. Medium Pekoes and Broken Pekoes were better supported. Fine and choicest lots, particularly Broken Orange Pekoes, in many instances fetched 1d per lb. higher, the following being among the best :—Talawakelle 1s 8½d, Dimbala 1s 6¾d, Campion 1s 6½d, Diyanilakelle 1s 6¼d, Hauteville 1s 6d, Annfield, St. Clair and Taurus 1s 5d per lb.

On account of the greater proportion of low-priced Tea included in the catalogues, the average is the same as on the 13th inst., viz., 8¾d per lb. At the 21st October, 1897, it was 8⅞d per lb.

Shipments from Colombo to Great Britain for the first fortnight of the month were 3½ million lbs.

JAVA.—In the absence of sales there is nothing to report except that 1,100 packages are advertised for the 27th inst.

Deliveries.

The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns, were :—

From 1st to 18th Oct., 1898.....10,734,198lbs.
„ „ 1897.....9,978,923 „

During the week the following have been printed for sale by public auction :—

	Sold. Pkgs.	Withdrawn. Pkgs.	Total offered. Pkgs.
India	43,197	5,078	48,275
Ceylon	23,805	741	24,546
Java		355	
Total	67,002	5,819	72,821

Also 960 packages from second hands.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated October 21st, 1898, says :—

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1898-1899.	531,417 pkgs.	486,604 pkgs.	18,649 pkgs.
1897-1898.	527,860 „	520,408 „	17,585 „

48,783 pkgs. Indian
25,085 „ Ceylon
... „ Java.
} Total 73,868 packages were offered in public auction this week.

The past nine months have shown a remarkable increase in the quantity of Tea exported from Ceylon direct to markets outside the United Kingdom, viz. :—

1898.	1897.	1896.	1895.	1894.
lbs. 17,037,941.	lbs. 11,911,213.	lbs. 10,053,323.	lbs. 8,813,641.	lbs. 7,006,167.

Progress has been most important in Australia, North America and Russia. Considering the export of Ceylon Tea from Great Britain during the above period has also materially increased, the quantity now taken abroad has become a very important trade factor, and has already caused a substantial reduction in the supply to this country.

Distribution of Tea exports from Ceylon from 1st January to the end of September.

MELBOURNE.

Mr. Alfred Harvey & Co.'s Monthly Report states :—

GENERAL.

Shipments from all ports are 14,150,000 lbs., as against 12,989,624 lbs. at same time last year.

The "Fazilka," "Bhundara," and "Bucephalus" have arrived from Calcutta during the month, and the "Darius" and "Euryalus" are afloat, so that shippers have had no occasion to complain of want of space. The Calcutta market remaining favourable for colonial buyers, a fairly good supply has been shipped.

Colombo buyers continue to complain of the scarcity of tonnage, the mail steamers having little or no available space for Australian ports for some time past, and consequently, although the market is favourable, it is impossible to send forward supplies in anything like sufficient quantities.

It seems strange that, with such princely rates as those now ruling from Calcutta and Colombo to Australian ports, a substantial attack is not made upon this valuable monopoly by some of the large steamship owners. Should a well-equipped company start even a monthly service, it could easily command a full freight throughout the year, and at the same time benefit tea, as also jute importers.

Chinas arrive in well-regulated quantities, but buyers are not so eager as they were, except for common kinds up to 5¼d. Prices are easy for all better grades and fancy kinds, whilst the supplies in Foochow are small, and rates again firmer; hence importers maintain a firm attitude.

Stocks in bond on the 1st October were 1,689,637 lbs.

CEYLON.

Shipments from Colombo are 7,000,000 lbs., as against 5,750,000 lbs. at the same time last year.

Only two public sales have been held, when 650 packages were sold at 6d. to 7d. for common to useful Pekoe Souchongs, and 6¼d. to 9¼d. for common to good hill-grown Pekoes.

Arrivals, which have been upon a very restricted scale, owing to scarcity of freight, have commanded the keenest competition as soon as shown, at extreme rates. Sales made show Dust to be worth 4d. to 4½d.; Fannings, 5d. to 6½d.; common rough Leaf, 6d.; milled and rough leaf Souchongs, 6¼d. to 6¾d.; even leaf Pekoe Souchongs, 6½d. to 7½d.; good leaf Pekoes, 7½d. to 11d. for good quality; tippy Orange Pekoes, 8d to 1s. 2d. for choice hill-grown.

Stocks in bond on the 1st were 288,227 lbs.

PEPPER.

Says the *Record* of 21st ultimo :—

Black.—A urther depreciation in value occurred, but at the close a firmer feeling is apparent. On the spot fair Singapore has sold at to 4⅝d. To arrive about 150 tons have changed hands—Singapore, and August-October (s.) at 4 9/16d to 4 11/32d, September-November 4 9/16 4½d, October-December 4 11/16d to 4 9/16d, November-January 4⅝d, and J ary-March 4¾d.

The shipments of Black Pepper for the first half of October com as follows :—

	1898.	1897.

United States.....	70	60
Total tons ...	530	130

At auction on the 19th inst. 56 bags light shelly Acheen @ Singa sold at 4¼d; 50 bags Aleppy retired at 4⅜d, also 80 bags Tellicherry 4⅝d per lb.

White is nominally unchanged on the spot in the absence of sales, to arrive lower prices have been accepted. In the latter position tons have been sold—Singapore, October-December (s.) at 8 1/16d dow 7⅞d, December-February 8 1/16d, January-March 8⅛d; Penang, Septe to December (s.) 7⅜d, November-January 7 7/16d, December-February and January-March at 7 9/16d to 7 19/32d per lb.

The shipments of White Pepper for the first half of October com as follows :—

	1898.	1897.
U.K.—Singapore... 140	220	80 110
„ Penang..... 80		30
Continent	160	60
Total tons.... .	380	170

At public sale on Wednesday 12 cases Singapore passed the ham unsold at 10½d for fine, also 102 bags Siam at 8½d per lb.

Black quiet. Singapore 4 9/16d spot and October-December shipm sales unimportant. Of White, 20 to 30 tons Singapore sold, November-January 8 1/16d and December-February 8⅛d per lb.

GINGER.

Cochin.—A barely steady market obtains, but sellers do not p some even looking for higher prices in the near future. Catalogues Wednesday embraced 51 cases 535 bags, of which 20 cases 230 bags at valuations : limed medium and small roughly cut and scraped, wo 40s, good medium and small washed rough 23s, ditto rather leaner rougher 21s per cwt.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 25th November, 1898.

Season Reports should be sent to the Printers, Messrs. Addison & Co., direct, and not to *Planting Opinion* Office.

Coorg.

Polli Betta, 16*th Nov.*—*Weather.*—Over 3 inches of rain last week. 1·5 in. one day. Since, it has been cloudy and drizzly in the evenings, but the moisture has not been enough to measure. It is years since the N.E. rains have been known to continue so late. They are probably helping trees bearing heavily, but must be somewhat of a nuisance where they are taking in *Crop*, which is in full swing in the other half of the district. *Plant-diseases.*—In spite of the continued rain, "leaf" appears to be passing off and coffee is looking very well. It is to be hoped there will be no second attack. These rains will diminish borers next season. They delay the flight season, and conditions afterwards won't be so favouring to the hatching out of the eggs.

South Mysore.

Mudigere, 15*th November.*—Your P.D. is one of the people who want hanging. He makes me say that some estates are on the "mind" instead of "mend." I wonder what he has got on *his* mind. It is a minor offence to say that there is "more" fever instead of "some," as I probably wrote. The *Weather* has improved very little, and we may get a record November in the way of rain. We are well over average, though of course this year's total fall cannot be compared with that of 1896 or 1897. There has been a little sun, but far too little, and for those who are picking I can imagine that things are most unpleasant. *Diseases.*—Leaf-disease is clearing off, having left some places untouched, while others have been affected from mildly to moderately bad. There has been nothing approaching the go of 1896. Taking it generally, I fancy that only very heavy bearing coffee and bad situations have been seriously touched. *Labour* seems to remain much the same. Coffee picking and paddy cutting will clash more than usual this year, I am afraid. *Health* remains fair; some fever and cough, but not much. *Crops* will be very late. There seems to be little ripening going on. It is not to be expected with the weather we are having. I hear they are picking in the West, where rain was earlier; but what little I have done is all the result of December rain, and a 5-cent drizzle in early March. Estimates generally are maintained, but one can only expect to have a larger proportion of cherry and tails than usual; some estimates have been raised, and I hear of none being lowered. Although not strictly a planting subject, one most interesting to many at this season would be a discussion on the various powders in use in India. There is practically no big game left in this district with all the native guns about, so rifle powders are

of less general interest than those for snipe and duck shooting. Ballistite has many friends, Schultze would have more if it would keep over a monsoon, and Amberite is worth trying, I am sure. It is strange that none of the gun-makers or gun-sellers appear to find it worth while to start a range for experiment.

THE GOVERNOR OF CEYLON ON THE TEA INDUSTRY.

HIS Excellency the Right Hon'ble Sir J. WEST RIDGEWAY, in his address to the Legislative Council of Ceylon on the occasion of the annual opening on 7th instant, made some very important references to the planting industries of the Island, and more particularly to Tea, its staple product. In pronouncing certain fears exaggerated, Sir WEST RIDGEWAY at least acknowledged that they were not absolutely groundless; but subsequently he was at pains to give a view that leans somewhat more towards optimism than towards the dark reverse side of the picture that has been persistently exposed of late. The Governor admits that the Planting industries have created Ceylon, and that it is still mainly dependent on them—chiefly on Tea. He admits that during the last year or two there has been a depression in the Tea industry. Indeed, he says:—"Responsible men among us have unmistakably suggested, if they have not positively asserted, that tea can no longer be profitably cultivated in several districts of the Colony, and that before the end of the year many estates will be abandoned and the capital expended upon them sacrificed." He considers it his duty to suggest consideration of the question whether the Ceylon tea industry is really doomed, or its days numbered, and he then proceeds to express his own opinion in the following emphatic words:—"My own opinion throughout this agitation has been that the fears which I have heard expressed on all sides of me are exaggerated, and that although there has been, and may continue to be, depression through the rise of exchange, falling prices, and (if I may suggest it) the reaction which inevitably follows undue inflation—and consequently loss in individual cases—yet this great industry is on the whole perfectly sound and stable, and in the absence of a visitation of God, against which the efforts of man might avail nothing, the tea industry of Ceylon will and must continue to hold its own against other tea-producing countries, even although the high profits which have been hitherto realized may to a certain extent be curtailed, and consequently the value of shares may fall. But is there a probability of a further fall in profits? Exchange, whatever the solution of the vexed question now under consideration may be, is not likely to rise much higher than it is at present, and, on the other hand, it will probably be comparatively fixed and stable, and free from those fluctuations which have been the chief obstacle to the investment in silver countries of European capital. There is a point below which prices cannot fall, and that point appears to have been reached. Prices are, I understand, now recovering, and, although the amount of tea exported from Ceylon and India in the present year is considerably larger than in 1897, the prices have during the current year been on an average substantially higher than in 1897. The exportation of tea to the United Kingdom has been somewhat reduced, but compensation has been sought and found in the new markets in other parts of the world discovered by the enterprise and energy which always characterized the planters of Ceylon."

We make no apology for giving at length so impo a pronouncement from such a high authority and tinguished statesman as the Governor of Ceylon. declares that he never has believed, and he does not believe, in the ruin of the staple industry of Ceylon thr economic causes. Upon his view of this point hinge best part of his administrative policy. Nothing but a b such as he has expressed would justify Sir WEST RIDG in so progressive a policy as he has adopted, and the of the sincerity of his belief is to be found in the fact he adheres to this policy, and means to push rai extension and other progressive measures to the of his ability and resources. At the same time does not wish to see the island entirely dependen one industry. Its prosperity was once founded on C and Coffee failed. But while Tea does not hold the pred nating position once occupied by Coffee, any dis to it would certainly entail great privation on the Co Not ruin, says the Governor, "not even the partial which temporarily followed the fall of the coffee indus The Colony is, he observes, far more wealthy than it twenty years ago, and its wealth is much more w diffused. "The country is more developed, new indus have sprung up; all branches of our revenue—our sav banks, the railway traffic, the consumption of luxuries the adoption of higher standards of living by the ma the purchase of land by natives—are certain indicatio increased and diffused wealth and prosperity." To sup these remarks, he quotes statistics of trade, compa 1877—"the halcyon year of coffee, when that indu touched the highest point of its career"—with 1897, w was "not a year of more than average prosperity for supply apparently having overtaken demand, prices b depressed, and exchange causing great stringency i money market. He shows that the total trade of 1897 of the value of 1,831 lakhs, against 1,234 lakhs in 1877 increase of 32 per cent. The imports in 1897 were va at 980 lakhs, against 627 lakhs in 1877: an increase of 5 cent.; while the exports were respectively 850 and 611 la an increase of 30 per cent. Of the 611 lakhs of expo 1877, coffee represented 500 lakhs, or 81 per cent., whi the 850 lakhs of exports in 1897, tea represented 470 la or only 56 per cent. This shows that, fortunately for prosperity of the Colony, important as tea is, it has no extraordinary preponderance of the coffee industry twenty years ago. Sir WEST RIDGEWAY proceeds:— 1877 Ceylon might, indeed, have been described as a cou dependent on one industry, for while coffee formed 8 cent. of her export trade, no other of her products am to 4 per cent., the produce of the cocoanut palm b just under that figure. In 1897 our largest industry f but little over half of our total trade, while the coco palm produce has advanced from 3·9 per cent. to 15½ cent., and may be now classed as a great industry whi yearly increasing in importance; plumbago, too, citronella have increased their relative importance by than threefold, cinnamon by two and-a-half-fold, and a nuts by 50 per cent." Two fresh introductions have t place since 1877, cacao and cardamoms. Cacao from 1877 rose to 51,101 tons in 1897, valued at 13 lakhs, o per cent. of the total. Cardamoms, from one-fifth of a

in 1877, have risen to 10 lakhs, equivalent to a little over 1 per cent. of the total. Cinnamon, the mainstay of the Dutch revenue, which fell on such evil times that in 1877 the export was valued at but 7½ lakhs, or about 1 per cent. of the total, recovered in 1897 to 22 lakhs, equal to 2½ per cent.

Elsewhere, the Governor of Ceylon remarks that the great hope of the industry is the opening out and creation of new markets, and vigorous efforts are being made in that direction. For instance, the exports to Russia up to the 25th October last increased, as compared with those of last year, from 373,192 lb. to 2,021,285 lb., to America from 604,066 lb. to 1,906,333 lb., and to Australia from 10,212,489 lb. to 12,279,692 lb. Labour has never been more abundant. The arrivals in 1897 were 153,000, the excess of arrivals over departures being 43,862, or only 2,619 less than the natural increase of the population of the Island by births. Only in 1876 and 1877 have there been so many arrivals. The figures of those years were 164,000 and 167,000, against 153,000 in 1897. During the first eight months of this year there have been over 100,000 arrivals. The departures were 77,000. The condition of tea from the point of view of cultivation has been good. Hence there is certainly a good deal to set against pessimistic utterances and forecasts. Sir WEST RIDGEWAY has, in short, made out a good case for Tea, and it is probable that his cheerful review of the situation will do something to re-establish confidence. He touches keenly upon the subject of over-production when, *apropos* of the extension of Cardamom cultivation, he refers first to this as "the inevitable result" of the fact that this has proved a particularly remunerative crop, and says next:—"The market for this product is small." These seven words are pregnant with warning. Whether growing cardamoms or tea, coffee, or cacao, cinnamon or cocoa-nuts, planters must always realise that when supply exceeds demand, values will suffer from depression. We take it that Sir WEST RIDGEWAY wishes his warning to be read between the lines of all his observations on Tea, not to apply to cardamoms alone. The market for Tea is not a small one; but it has limits: and the moment demand gets in excess of the world's requirements, the reduction of prices sets in to undermine the evil of over-production.

TEA STATISTICS.

WE give on another page an interesting series of statistics that has been issued from the Office of the Director-General of Statistics. It shows that in Southern India the area of land under Tea is:—

Madras	...	6,335 acres
Travancore and Cochin	...	30,076 „
Total	...	36,411 acres

but these figure are avowedly unreliable. Special mention is made of Travancore planters as unwilling to furnish information. We cannot but think that a change of policy is desirable. The statement is made that although the area under mature plants in Travancore and the labour force are shown to have increased three-fold, the quantity of manufactured leaf is returned at just half the figure for the previous year. This might be read as pointing to deliberate misrepresentation, but we trust there is no ground for any idea of that kind.

It is interesting to note that Indian consumption may be put down at about 7,000,000 lb., of which no less than 3,000,000 lb. appears to be *imported tea!*

The total is small, as the natives of India are not generally tea-drinkers; but the proportion of imported tea that appears to be retained in India—not re-exported—is excessive.

The Calcutta quotations given would seem to be open to question. For instance, the level for 1873 is given as 100, 1889—77, 1892—71, 1894—52. Yet the average prices for the last three of these years are put down as follows:—

	Broken Pekoe.	Pekoe.	Pekoe Souchong.
	AS. P.	AS. P.	AS. P.
1889	... 9 9	7 5	5 7
1892	...11 3⅓	8 9	6 5¼
1894	...11 8	9 4⅘	7 2⅝

It is not easy to see how such averages can be reconciled with the respective "levels" given above, viz., 77, 71, 52. Apparently a *rise* in price has led to a *fall* in the level!

HAND-MADE *v.* MACHINE-MADE TEA.

A SHORT time ago we touched upon the disadvantages under which South Indian tea-planters labour for want of central factories to manufacture the produce of groups of estates. If machine-made tea is to be preferred to hand-made, there can, we think, be no doubt that small factories must work at a very considerable disadvantage as compared with large ones. Not long ago a Ceylon planter drew attention to the amount of factory supervision that is left, even in large concerns, to low-paid native tea-makers. India, he said—not meaning *Southern* India, we fear—had always had European factory superintendents; and *apropos* of the same subject he added that he thought there could be no doubt that the greatest mistake in Ceylon had been in putting up small factories for each estate, instead of concentrating in large central factories, when the cost of a European tea-maker, divided among the several estates, would not come to much more than the present system, with, he thought, far greater benefit to the estates concerned. On the other hand, the *Indian Planters' Gazette*, alluding recently to the desirability of pushing Indian teas in Russia, said that the Russian consumer eschews tea manufactured by the process in use on English plantations. In his eyes, machinery for rolling the leaf and artificial heat applied to wither it are abomination. Our contemporary observed: "A great Moscow merchant remarked lately that the difference between hand-made sun-dried tea and that resulting from rolling and withering machines is the difference between a waltz played by Strauss's orchestra and the same tune mangled by a barrelorgan! Nor is this all. To suit the Russian taste, the leaves when plucked are allowed to stand in heaps, and are moistened till the process of fermentation sets in, which gives a peculiar, but not disagreeable flavour, and deprives the cheering drink of some of its noxious qualities. When our planters have grasped this fact, then, and not till then, will they find a market for their wares in Holy Russia." By these facts, and by the attempt that is being made (aided by a heavy protection duty) to grow tea in the Caucasus, the *I. P. G.* is led to fear that the chances of Indian tea in Russia are not too bright. This apart, however, we would ask our readers to express their opinions as to whether hand-made tea is really preferable to machine-made, or *vice versâ*. If the former, labour is certainly cheap enough in

Southern India to give the hand process a fair chance, while the difficulty of centralising factories certainly places machinery at a serious disadvantage. It may be said that this subject, like that of leaf-disease in Coffee, has been threshed out *ad nauseam*, and that nothing can be hoped from further discussion. But is this the case? We do not even think it is with regard to leaf-disease.

SIGNED CORRESPONDENCE.

[Under this head, letters, replies and remarks will only be admitted if signed by the writer. The object is to promote the interchange of opinions, experiences, etc., between planters who are willing to support their remarks with their signatures.]

TEA PRUNING FOR THE NILGIRIS.

RAINFALL 50. ELEVATION 5,000 TO 6,000.

Now that the season for this work is approaching, the question that rises up generally is "What kind of pruning shall I do."

From my own observations extending over many years of successful cultivation, I am inclined to think that a *low prune* for *China*, if it needs it, is advisable in the cold months, but if a light prune is to be done, the operation should be delayed till the cold February winds are on, and the light pruning be then quickly got through. A few weeks brings the flush out, and if tender leaves just catch the cold winds the results are unsatisfactory; hence it is better that no risk of this be run.

A light prune in January (or as some do in December) brings the tender shoots out far too early, only to be nipped by the biting cold winds in February.

For flavour in the China, undoubtedly a light prune with manure is the best. The nearest approach to a Darjeeling Tea is thereby possible, if of course the manufacture be regulated and watched.

It is a great mistake to expect the knife to accomplish the work of manuring.

When the Tea is brownish, flavor Congouish, and there is an absence of tip, the usual resource is low pruning, but I think manuring is what is needed oftener, to produce the nice soft buttery leaf that mashes readily between thumb and forefinger.

A low prune on a China bush whose framework has been judiciously preserved and cultivated gives encouraging results, but on a bush already hacked and whose growth is a multitude of suckers, low pruning can only increase the trouble and convert the bushes into brooms. Leaf borne on these brooms never makes good tea. The colouring is always black, and the liquor weak and flavourless. Not all the skill and appliances procurable can make good tea from brooms. I have noted such skill and appliances put to this kind of leaf, and the result has been a 4*d.* average!

Now as to Hybrids and Assams that have been (as I undoubtedly think should be the case) grown as *Standards*, I consider that these should never be low pruned except in June-July.

Pencil pruning, as in the case of China, is best done in January-February.

I have seen bushes of these varieties low pruned in September bleed most profusely; and growth retarded thereby and the bushes sulking for years as the result.

I have been asked if the removal of suckers fr Hybrids and Assams is advisable. I think not, as t results of an experiment in this direction were not encoura ing. The old framework is so sapped that it seems pow less to again throw out the tender leaf and live; better to select the leading and stoutest suckers and reform t bush on these, sawing away the old stem.

Having recently tried the Assam plan of cutting do young two-year old plants to six inches from the grou I hope to report results in time. The work was done June-July, when the sap of tea is decidedly down on t Nilgiris, it being the hibernating period of it. By tw year olds, I mean two years from putting out, or three ye from seed. Red spider, it may be noted, is always at worst in September, so that a June-July sweep-down puzz that interesting crustacean.

(Sd.) THOS. BROWN.

GLENDALE, COONOOR.

NOTES.

Cost and Price. It is said that the cost of the T produced by the new Dimbula T Company works out 4½*d.* per lb., and that the average s price during the year was 8½*d.*

Low Cost. The Manager of the new Dimbu Company in Ceylon states that t actual cost of the Company's tea during the past seas was 3·89*d.* per lb. for Colombo. This shows what *can* done.

The British Tea Duty. A Committee, consisting of Mess Rutherford, Bois, H. Anderson a Martin Leake, has been appointed on behalf of Ceylon discuss this matter with representatives of the Indian T industry.

The Java Cinchona Factory. The terms upon which the Ja factory works up planters' cincho bark are a commission of 7 flori per kilogramme (about 4*d.* per oz.) The proceeds of t quinine go to the planter.

North Travancore. Some of the Companies at wo in North Travancore are turni their attention to Coffee and Cardamoms, as well as T It is reported that a total area of over 4,600 acres will opened and planted in 1899, and of this not less than 2,0 acres is to be under coffee and cardamoms.

Planting in Costa Rica. Mr. Huntley Thring has a hi opinion of the prospects of cof and cacao in this, about the best-governed and richest Central American States. He considers that young m of the right stamp, with £2,000 to £3,000 of capital, goi out there now would stand "to make a fortune," which is well nigh impossible to do in India or Ceylon now.

Indian Gardening. Our enterprising Calcutta conte porary has now included "T Amateur's Domain" in its pages. It also gives illust tions, to point a very interesting paper "About Papa

Trees." The last number also contains some interesting remarks by the Hon. Mr. J. Buckingham on the Florida Velvet Bean in Assam. Mr. Buckingham does not seem to think very much of this bean as a vegetable.

The Tea pest in Ceylon. Mr. Willis, of the Peradeniya Gardens, does not think the disease will be serious if planters only take measures against it as soon as they notice an outbreak of it on their estates. If they neglect to do so, no one can answer for the consequence. Mr. Willis is intending to make a tour through some of the planting districts shortly, to notice the extent of the disease on the tea.

New Markets. Germany is being opened out by Ceylon, and it is now observed by a Ceylon contemporary that there seems little doubt that Germany and also Russia are much more promising fields than the United States of America, and the proper policy, therefore, to pursue seems to be to "mark time" in the States, and direct all energies towards pushing tea in Germany and Russia.

Scarcity of Tea anticipated! *Apropos* of the campaign of Ceylon Teas in Russia and elsewhere, Mr. Stanton, of Messrs. Gow, Wilson, and Stanton, is reported to have expressed his opinion that, if the new markets now being captured are secured—and he did not doubt they would be secured—*we are certain to be short of tea.* Coming from such a quarter, this statement should be very comforting to the owners of tea property.

A Model Director. At the last general meeting of the Indian and Ceylon Tea Trust Co., Mr. Keith F. Arbuthnot, the Chairman, speaking on the report, which was of a very unsatisfactory character, stated that the Directors and their family connections were by far the largest shareholders, and that they had not parted with any of their holding. "Indeed," said the Chairman in a burst of confidence, giving the position away altogether, "*we couldn't if we wished to.*"

Calcutta Tea Sales. The sales on 11th instant were about the best of the season, all the 29,000 packages offered being sold. Competition generally was brisk, the market remaining steady, without material change in prices. Dooars teas elicited strong competition. Darjeeling sold well, as also a few of the better Assam marks. Active demand existed for outside markets, and Bombay buyers were keen competitors for wiry pekoes. The average price realised at the sales of 3rd inst. was 5 as. 11 pies, an improvement of 3 pies.

Tea Prospects in Ceylon. Mr. Joseph Fraser, who has had a round of "visiting" since his return from his brief holiday trip, is well pleased on the whole with what he has seen in the different districts. Of course, says the *Ceylon Observer*, the prolonged drought during the south-west monsoon months told against estimates; but, altogether, the present prospect is satisfactory. As regards the making of "fine teas," Mr. Fraser reminds us there may be too much of a good thing—that if everybody takes to making fine teas, the price thereof must, of course, fall; but with our many lowcountry places, there ought always to be abundance of medium and cheap teas.

The Agricultural Chemist in Ceylon. The following table of Mr. M. Kelway Bamber's fees will probably interest many of our readers :—

1.	Reporting and advising on manufacture and analysing the leaf, etc., made tea	R100
2.	Advising on manufacture, etc., without analysis	R50
3.	Analysis of soil on sample	R50
	Do. three samples	R100
4.	Analysis of compound artificial manures	R30
5.	Do. crushed bones or oil cakes	R15
6.	Do. lime or limestone	R10
7.	Do. water	R30
8.	Recommendations as to manuring based on analysis furnished by applicant	R5

London Tea Market. In their telegram to Colombo, dated 10th instant, Messrs. Gow, Wilson and Stanton reported that the London Tea market was generally unchanged, but Good Liquoring Pekoes were easier quotations—fair liquoring Ceylon Pekoe Souchong 6½*d.*, average 8½*d.*—both unchanged. Reuter reported the same day :—Tone of Ceylon Tea.—Common to medium kinds, good demand at fully previous rates. Fair Pekoe Souchong he quoted at 5½*d.* (same as last week) and the average 8⅝*d.* (⅛*d.* up). 18,000 packages of tea were offered for sale, of which 17,000 sold. Of Indian Teas 50,000 packages were offered and 46,000 sold, the average being 8½*d.* (an advance of ⅛*d.*)

An Entomologist for Ceylon. The Ceylon Budget for 1899 provides, at the instance of the Planters' Association, for a salary of Rs 5,000 a year, with a house at Peradeniya, for an Entomologist. The Governor states in his official "message," that "it is not contemplate that the very suitable gentlemand whom it is proposed te appoint will permanently assume duties before the middlo of September." Mr. E. E. Green, at present *Honorary* Entomologist to the Government of Ceylon, is the gentleman referred to. His appointment will, no doubt, be widely approved in Southern India, as he has always manifested readiness to assist planters in these parts as well as those of Ceylon. In particular, the subject of the importation of lady-birds for the extermination of scale pests has received and is still occupying his attention. This is a subject in which Southern India is greatly interested.

The Currency Question. At a meeting of the Committee of the Indian Tea Association; London, held on Tuesday, 25th October, it was decided that Messrs. D. Cruickshank and J. N. Stuart should be asked to prepare a further statement to be sent in to the Currency Committee in time for their first meeting on the 4th inst., and dealing with such points in the evidence already recorded, as well as others, as may appear to them to be desirable. The Planters' Association of Ceylon has resolved :—"That a hearty vote of thanks be conveyed to Mr. T. N. Christie for his able advocacy of the producers' interests before the Currency Committee, which this Committee consideers could not have been more convincingly argued on their behalf; (ii) that Mr. Wm. Martin Leake be thanked for the ready assistance he gave and for his

strenuous efforts to place the producer's position before the public."

Cinchona in the United States. Cinchona cultivation in the United States has apparently come to nought, says the *Madras Mail.* In an American official report it is stated that the value and demand for quinine were strong incentives to home production, and the cinchonas which furnish the drug were raised and distributed for cultivation, mostly in California and Florida. But in no instance was success obtained; and it is further remarked that cinchona bark is so largely furnished by plantations in the East Indies, and so cheaply, that West India growers have abandoned the culture of the trees. The eucalyptus tree has also not proved a success, except in California, though there was at one time a great demand for plants owing to the reports from Australia that plantations tended to reduce fevers in malarial tracts. It is now stated that no special merit, either in hardness or in utilisable economic products, has been found in any of the 40 species experimented with, so that their further propagation was abandoned several years ago.

Cinchona in Ceylon. A rise in prices of Cinchona, and European complications that have suggested thoughts of a possible further rise, have made old Cinchona planters reflect whether the time has not come for giving renewed attention to this bark. It is interesting to note that one of them remarks of the "old days" of Cinchona in Ceylon. As a matter of fact he says—and he lays claim to a good deal of experience—he seldom saw good *hybrids* or succirubra from *good seed* die on boundaries, or in proper soil in Uva. Young fields got wet feet and went out of simply galloping consumption in the most pathetic manner in no time, but with quinine at the *old prices* they *paid* to grow even as thick as your arm. He was long ago firmly convinced that the wild rush for seed at *any* price led much that was bad and immature to be gathered and sold. In fact, he sowed deliberately what he considered immature seed, *i.e.*, gathered from a too young tree in one of the nursery beds, and at six inches high the plants, though healthy enough, had the peculiar spindly look seen so often among subsequent failures. He adds that it has been proved that Ceylon can grow good Cinchona. Good seed is necessary, however, and this must be planted in a suitable soil.

Colombo Tea Sales. At the sale of Tea at Colombo on 9th instant about 5,761 pkgs.

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain per ton:—

61·50 lbs. Nitrogen.
57·38 „ Potash.
14·92 „ Lime.
13·68 „ Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the 1898-1899 crop of seed from the parent trees of above analysis at Rs.6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the

MANAGER, ARIENKOW ESTATE,
Shencottah.

=476,744 lb. were offered, of which about 4,466 pl
=378,881 lb. were sold. The leaf teas again met v
keen competition and realized full rates. Medium Brok
were not in such strong demand, and closed a trifle eas
Fine teas sold at almost previous rates. The finest tea
the sale were: High Forest, Lynsted, and Glasgow—
a small break from New Galway. Amongst low-gro
teas some of the best were: Arapolakande, Polataga
Freds Rube, and Eila. By the way, the *Times of Ce*
gives the following statistics to show the growth of th
sales:—

		Offered. lb.	Sold. lb.
1897	...	... 29,516,534	22,999,956
1898	...	... 31,177,037	25,098,132

These figures have a special interest in view of attem
that have lately been made to show that sales *in Calcu*
do not compare favourably, in point of price, with th
made in London. Colombo, which works under somew
similar general conditions to those that effect Calcu
would at least appear to have established its utility a
selling market.

Ceylon Tea Estimates. At a meeting held on 11th insta
the Planters' Association of Cey
resolved:—"That an official estimate of the Tea Crop
Ceylon be compiled by the Association from the
January to 31st December, 1899. (2) That District Asso
ations be asked to compile such estimates for their
tricts, and furnish them to the Secretary, Planters' Asso
ation of Ceylon, by the 30th November, or as soon the
after as possible. (3) That district estimators be reques
to obtain their estimates from acreages as far as possib
the statistics received to be considered confidential, a
not to be published by the estimators, and the total o
trict acreages only to be given. Such returns should in t
opinion of the Committee be:—

(*a*) Total acreage in Tea.
(*b*) Acreage in bearing.
(*c*) Total crop.

(4) That forms be issued separately to each Super
tendent to be returned by him in a closed cov
Resolved:—"That the foregoing resolutions be forward
to the Secretaries of the various District Associations, w
a request that they will kindly take immediate steps
furnish the Committee with the desired data." There
nothing too inquisitorial about the procedure, and
cannot but think that the example should be followed
both Tea and Coffee Planters in Southern India.

Indian Tea for India. Commenting on our recent
marks anent the need of develo
ment of Indian demand for tea, the *Indian Plante*
Gazette observes that while agreeing with much that
say, it "must point out that the Indian Tea Supply Compan
Limited, which was brought into existence for the purpo
of selling Indian tea to the poorer classes of this count
in small packets, has so far failed to achieve the object
view. Evidently, the average native of India has not y
been educated to the point of taking his morning cup
tea. In the large towns it is a familiar sight to see t
itinerant tea-vendor going his round with a large tin c
filled with a decoction which passes for tea, and ev
small 'tea shops' have sprung up where the *habituè* tak

his morning cup. But outside the Presidency towns *chah* is practically an unknown quantity." This is all true, but the non-success of the Company mentioned does not affect our arguments. It is not a local "Lipton, Limited," that is wanted, but a local "Lipton." The individual element is more powerful than the joint-stock for such work as we have in view. Our contemporary acknowledges that there is a very large field in this country for Indian tea, and suggests that "a syndicate of natives, who would buy up large quantities of the lowest grades of dust and leaf, and establish agencies in all the towns and important villages for the sale of this cheap tea, would soon be able to develop the taste for tea among the people." "Of course," it adds, "the stuff would have to be sold in pice packets." We by no means agree with the last remark, but we certainly think that small capitalists might make a good thing out of pushing tea in India.

GENERAL ARTICLES.

THE U.P.A.S.I. SECTION.

[Under the Control of the Secretary, U.P.A.S.I.]

Mr. E. E. Green, Honorary Entomologist to the Government of Ceylon, has kindly permitted publication of the result, so far, of his experiment in regard to the introduction of Ladybirds from the Cape. It appears that the experimental consignment of the "Ladybird" beetle—*Exochomus nigromaculatus*—from the Cape of Good Hope duly arrived. At the time of despatch there seemed to be some difficulty in arranging for the transport of a Wardian case, so the beetles were packed in moss in a wooden box, together with an ample supply of food, and despatched direct by *letter post!* They reached Mr. Green in about four weeks' time, and he reports:—"On opening the case, the moss was found to be thickly strewn with the dead bodies of the beetles. But a careful search resulted in the discovery of five living beetles and four young larvæ (evidently born on the voyage). These were at once transferred to the breeding jars and supplied with local scale insects, upon which they commenced to feed readily. Three of the beetles and two larvæ survived the journey only by a few hours. The others are still alive and healthy, and the larvæ have completed their transformations, so that I have now four adult living beetles. I fear that this number is too small to hope to raise therefrom a fresh stock. It is even uncertain whether the two sexes are represented. But I consider the result of this experiment to be most encouraging, as proving the possibility of obtaining living beetles without the expense of sending a special commissioner for their collection and transport."

Mr. Green fed the beetles upon "Green bug" (*Lecanium viride*) and *Pulvinaria psidii* and said:—"They seem to prefer the large egg masses of the latter insect: but they also wipe out numbers of the young larvæ of the green-bug, though they do not appear to tackle the older insects. I feel, however, sure that in the absence of other scale insects they would readily subsist entirely upon the Lecanium."

In a later letter, he reported that a few young larvæ had recently appeared in his breeding jars. These had undoubtedly been born since the arrival of the beetles from the Cape. He is in hopes of being able to rear these up and to obtain a third brood from them.

Inquiries concerning Ladybirds resulted in a counter-inquiry from the Cape concerning fruit pests. A letter on this subject was addressed to the Press, but the answers received are unsatisfactory, as while fruit in India is infested by maggots, no one appears to have identified the species to which the depredators belong. The Agricultural and Horticultural Society of India, for instance, report that Mango and Lichi crops suffer somewhat by being attacked by maggots, but the Secretary has not yet succeeded in capturing the mother-moth. It is to be hoped that this important matter will now receive the attention it deserves. General Morgan has kindly promised to collect and forward specimens of certain flies referred to in his letter published in the last issue of *Planting Opinion*. No doubt these will lead to their identification.

Apropos of this, readers will find in the present issue a reprint of a very useful Circular of the Royal Botanic Gardens, Ceylon (Series I., No. 7, 11th June, 1898). This gives instructions for collecting and sending specimens of plants and insects for report. To some inexperienced collectors this circular will convey interesting hints, and it is hoped that planters and others will kindly study it before despatching specimen ladybirds or "pests" to the U.P.A.S.I. or elsewhere. Correct classification can only be effected when specimens arrive "in good order and condition."

COCOA DISEASE.

The Planters' Association of Ceylon has resolved to suggest to Government the advisability of having the following simple rules from Mr. Carruthers' report circulated in Tamil and Cinhalese for the information of Native cultivators of Cocoa:—

RULES.

Recent observations and experimen ts have proved that the canker in the bark spreads to the pods on the bark; also that the production of canker spores on the pods is extremely rapid, only a few days

R. VENKIAH BROS.,
PHOTOGRAPHIC ARTISTS, 161, MOUNT ROAD, MADRAS.
Tea Gardens, Bungalows, Horses, Groups and Portraiture on the Shortest Notice.
HIGH CLASS WORK ONLY AT THE LOWEST POSSIBLE RATES.

AMATEURS' WORK UNDERTAKEN, AND ALL PHOTOGRAPHIC REQUISITES KEPT IN STOCK.
CHEAPEST HOUSE IN MADRAS.
[22-10-98—t.f.o.]

being necessary for large bodies to be formed, and therefore it is of the highest importance that every effort should be made to destroy all diseased pods.

BARK CANKER.

Cut all the diseased tissue and two inches round burn all portions so removed.

POD DISEASE.

Take off all pods with a trace of disease and burn them (the small pods of an inch or so in length are generally dried up before they are attacked by fungi).

In cases where burning is impossible bury the pods with as little disturbance as possible, and put a good layer of lime over them before covering them up.

COFFEE PLANTING IN TOUNGOO, UPPER BURMA.

THE *Ceylon Observer* of 11th inst. writes :—

We had an interesting call on Wednesday from Mr. James Petley, after long service in Burma, retired to plant coffee on one of the Karen Hill ranges in Upper Burma. Here Capt Petley secured 200 acres of fine forest-land at an elevation of 3,000 feet, the Karens agreeing through friendship to his having it, and the Government sanctioning the transfer. He got his first coffee seed in 1875, the son thought, from Ceylon; but it must have been from Mysore, since no leaf disease appeared on his plantation of 120 acres until last year. Had the seed been from Ceylon, the disease would have developed much earlier; but how or why it developed last year is a puzzle. For the plantation is quite isolated—no other coffee in Burma until Tavoy in the far South is reached, where Mr. Watson from Ceylon (supposed to be dead) pioneered. The Messrs. Petley got good coffee crops for 10 or 11 years and they did well, because they sold it all locally in Rangoon, prepared, ground and in tins—so combining the planter's, the merchant's and middleman's profits. They used one of Walker's pulpers. Now, however, the leaf fungus has wrought sad havoc, and Mr. Petley came to us for information as to planting Para rubber. We showed that it was impossible at 3,000 feet. He would require to find a piece of suitable land in the low country. We advised an experiment in cinchona—seed from Bengal—on the coffee plantation: also to see if cardamoms (for local sale) would not do in the jungle. Tea, Mr. Petley said, they could not touch; because the labourers (Karens) got nearly double the daily pay of coolies in Ceylon. He says there are great stretches of very fine land; but there is difficulty in getting any of it, as Government will do nothing for would-be purchasers; the owners being the Karens. Mr. Petley had been in England on furlough and is now on his way back to Burma.

CEYLON AND CONTINENTAL MARKETS.

THE following extracts from the proceedings of a meeting of the "Thirty Committee" (Ceylon) on 12th inst. should interest our readers :—

CEYLON TEA IN AMERICA.

Resolved :—"That Mr. Mackenzie be informed that the 'Thirty Committee' vote a sum of £10,000 for pushing and advertising Ceylon Tea in America and Canada during 1899. (2) That the sanction of the Governor in Executive Council be obtained to this appropriation."

CEYLON TEA IN RUSSIA.

"That the thanks of the committee be conveyed to Mr. T. N. Christie, and that his action be approved, also that a further sum of £500, if deemed necessary by Mr. Christie, be voted for the additional advertisements referred to."

CEYLON TEA IN GERMANY.

The report of Ceylon Tea in Germany by Messrs. John Hagenbeck & Co. was laid on the table.

Mr. John Hagenbeck addressed the committee and explained his views generally. Resolved:—"That a grant of £750 be given to Mr. John Hagenbeck for pushing and advertising Ceylon Tea in Ge many under the appropriation already sanctioned, (2) that the com mittee will be prepared to further grants in proportion of one-thir to two-thirds of amount expended on accounts and vouchers showin expenditure being submitted."

CEYLON TEA IN NORWAY AND SWEDEN.

Resolved :—"That a sum of £5 be granted for pushing an advertising Ceylon Tea in Norway through post cards as estimate through Mr. Starey, (2) that the sanction of the Governor in th Executive Council be obtained to this appropriation."

Resolved :—"That a box of Ceylon Tea made of Ceylon woods b presented to His Majesty King Oscar, on the occasion of his 70t Birthday, and that Mr. A. J. Austin Dickson be asked to arrange fo the presentation on behalf of the Committee. (2) That the sanctio of the Governor in Executive Council be obtained to an appropria tion of £25 in this connection."

TWO NEW EUCALYPTS.

WE (*Ceylon Observer*) have received from the author copy of his paper (with plates) on two well-known bu hitherto undescribed species of Eucalyptus. The author i Mr. R. T. Baker, F.L.S., Assistant Curator, Technologica Museum, Sydney. These are :—

E. Bridgesiana, sp. nov. "Apple," "Apple-topped Box," "Woolly butt," of New South Wales. "But-but" of Gippsland, Victoria "A tree of considerable size" (Woolls); "grows to a great height particularly in loamy soil" (J. Manns.) Bark whitish-grey, wrinkle or tessellated, short and brittle in the grain, not fibrous, almos exactly identical with the Box, *E. hemiphloia*, when freshly cu giving out an aroma similar to the ordinary oil obtained fro Eucalyptus leaves, extending almost to the ultimate branchlets.

Hab.—VICTORIA: Gippsland ("But But," "Apple-tree," "Apple tree Box," "White Box," *A. W. Howitt, F. G. S*). N. S. WALES Colombo* ("Apple-top Box," *W. Bäuerlen*); Albury ("Apple," *D Andrews*); Gerogery ("Woolly-butt," *J. Manns*); Rylstone ("Woolly butt," *R. T. B.*); Bathurst ("Bastard Box," *W. Woolls*).

TIMBER.—It is a fairly hard, whitish-brown timber, but it is onl good for indoor work, as it decays rapidly when exposed to the air o placed in the ground. It is not used where strength and durability are required; fairly good for fuel.

OIL.—(*a*) *Leaves.*—646 lb. of leaves with branchlets, distilled Feb 1898, gave 59 ounces of oil, or an average of ·571 per cent., a ver satisfactory result. The oil is a little red in colour, and a few preli minary tests indicate it to be a good oil.

EUCALYPTUS PALUDOSA, sp. nov.—(*E. Stuartiana* F.v.M., var *longifolia*, Benth., B.Fl. iii. p. 244). "Manna," "Yellow," "Ribbony," "Swamp," or "Flooded Gum."

A tree "not exceeding 80 feet in height" (Sir W. Macarthur), with a diameter 6 feet from the ground 1ft. 6in. to 2 feet. In the young state up to a trunk of 5 to 6 inches it is very similar to *E. viminalis* Labill. Bark brown at the butt, bluish-white on the trunk and main branches, and yellow on the smaller branches and limbs decorticating into long ribbons of 30 feet or more suspended from the forks and trunks of the trees.

Hab.—Monga (Braidwood, *W. Bäuerlen*); Delegate (Bombala *W. Bäuerlen*); Wingecarribee (*W. Woolls*); Hill Top (*J. H. Maiden*) Barber's Creek (*H. Rumsey*).

TIMBER.—The timber is much more difficult to season than that o *E. Gunnii*, Hook., and is also specifically heavier. It is a close grained, hard timber of a light reddish colour, and I should conside it a much more durable timber than *E. Gunnii* or *E. viminalis*. Si W. Macarthur states that it is "said to be good." Dr. Woolls was o opinion that it is not suitable for any purpose, but Mr. H. Rumsey of Barber's Creek, informs me that sound logs will last 30 years i the ground. My own opinion is that if well seasoned it is a good sound, hard, durable timber, and useful for many purposes.

OIL.—The leaves are not rich in essential oil, as 394 lb. of leave with terminal branchlets, distilled June, 1898, gave 15 oz., or ·243% It is slightly red in colour and is probably (from preliminary tests not a good oil, and as the yield is not good it could not profitably b extracted.

MILLIE & REDMOND, late P. THOMPSON & CO., *Ootacamund, Engineers and Contractors.*

TEA IN RUSSIA.

At a meeting of the Tea and Produce Committee in London on 17th ult., one member, knowing Russia well, glanced at the list of papers in which Ceylon tea is being advertised in the Czar's dominions, and very promptly said that those in Siberia, of which there were a good many, were useless, and that the money being so expended was practically lost. A leading broker confirmed this, and said he was decidedly of the opinion that present efforts, at any rate, should be confined to Russia proper. He based his remarks on the proximity of China, and the enormous distance tea, to supply any business which might arise, would have to travel. The Secretary read the letter from Mr. Christie, in which it was stated that it was desirable that firms shipping tea to Russia and others interested in the Russian trade should be apprised of the fact of the advertising, and be informed of the papers being used. The same broker said he knew of all the firms in London who were sending samples to Russia, and on being supplied with type-written copies of the list of papers, he would send them round. Fiscal difficulties at the Russian Frontier were mentioned, and Mr. Stopford Sackville gave some useful information as to the best lines to be adopted and people to be approached. He spoke of Mr. Austin Lee, of the Embassy, Paris, who is Commercial Attaché for the whole of Europe.

A DISGRACEFUL INTERFERNCE WITH TRADE.

The London Correspondent of the *Times of Ceylon* says:—

Referring to the advertisements now being inserted in Russian papers, I will make a suggestion which has perhaps already been acted upon. In a new campaign such as is being now commenced, the great object is to catch the eye, and consequently the attention, of the Czar's subjects. There is likely to be a good deal of poor printing in 46 Russian papers. A perfectly similar electro inserted in each, and all of the papers (or those which will accept electros) would be very effective in securing the notice aimed at, and if this has not been already arranged, the "Thirty Committee" will be well advised to see to its being carried out.

T. R. TAWKER & SONS,

DIAMOND MERCHANTS, JEWELLERS AND SILVERSMITHS,

MOUNT ROAD, MADRAS.

To approved Customers in the Mofussil or others furnishing a suitable reference, we are always willing to send a selection of goods on approval. Our Show Rooms on the Mount Road contain the finest assortment of Diamond, Gold, and Silver Jewellery, and Electro-plate, while our Workshops turn out the best work in Southern India.

Catalogues free on application.

[w. 19-11-98—13-5-99.]

2

It is time that some active steps were taken to ensure fair treatment at, and smoother grooves for, the entry of our tea through the Russian Customs. I heard of a case this week of £4,000 worth of repacked Ceylon tea being refused at the Russian Frontier, and it is back again in a London warehouse. The owner lost £1,000 by this action of the authorities, which was based upon some trivial error.

TEA COMPANIES.

Eastern Produce and Estates Co. pays 2½ per cent. interim dividend on ordinary shares for the half-year.

Nuwara Eliya Estates Co. pays 3 per cent. interim dividend on ordinary shares for the half-year.

Kintyre Tea Co. declares a dividend of 5 per cent. The average yield of tea in bearing was 519lb. In reply to questions, the Chairman stated at the meeting of shareholders that the price of the Kintyre tea to Australia was 10·83*d.*, the net price being 8·67*d.*, while the net price realised in London was 6·18*d.* He went to Kintyre to ascertain whether there was a fair division of the two classes of tea. The tea-maker stated that they were the same, but Mr. Bell, the manager, was of opinion that the teas sent to Australia were rather better. The prices in Australia were very good—much better than in England.

Indian and Ceylon Tea Trust Co.—The Directors, in presenting the first annual report and accounts, made up to 30th June, 1898, regret that the period elapsed since the formation of this Company has been an unsatisfactory one for the Tea industry generally. The chief causes of depression were the rise in the exchange and the fall in the price of tea, but the Directors now look forward to a general improvement in the conditions. The accounts show that the total income earned to 30th June, 1898, amounted to £3,061 4*s.* 10*d.*, and after paying interest and the expenses of carrying on the Trust, a net balance remains of £2,189 1*s.* 8*d.* No dividend.

Carolina Tea Company.—The report states that the actual tea crop from the Company's properties was 939,491 lb., as against an outturn for the previous season of 893,288 lb., exclusive of Bellangalla estate (sold in 1896-97, and which produced 36,778 lb. tea in that season). The cost of the tea, free on board Colombo, was 5·10*d.* per lb. compared with 4·88*d.* per lb. for the previous season, the extra cost being due entirely to the advance in exchange. The average gross sale price in London was 8·02*d.* as against 8·26*d.* in 1896-97. In addition to the tea crop, 441 cwt. of cocoa and 307 bushels of coffee were obtained, as compared with 450 cwt. and 413 bushels in the previous season. The reduction of profit shown by the accounts from the earnings of last and previous years was caused mainly by the considerable advance in rates, both of exchange and freight during the season, and which entailed an extra cost of working equal to nearly 3½ per cent. on the capital of the Company, while the average selling price of the tea was about ¼*d.* per lb., below that of the previous year's crops. Tea in full bearing is 1,560 acres (yielding 480 lb. per acre), in partial 556 acres; not yet bearing, 312 acres; cocoa and coffee, &c., is 149=2,577 total acreage. To reserve is added £1,200, bringing the reserve total up to £7,200. The Directors express their entire satisfaction with the working of the staff in the Company's employ. The Company for 1893 paid 11¼ per cent., for the years 1894-96, 11 per cent. each year; an interim dividend last April of 4 per cent. per annum. Final for the year not yet declared.

Vagan Tea Compaay proposes to employ money in searching for and working plumbago.

Scottish Trust and Loan Company of Ceylon, Limited.—Capital, £125,000; First Issue (fully subscribed), £75,000; of which paid up, £45,000; Reserve Fund, £10,000. The report states:—The past season has not been favourable for the flushing of Tea; the estimated yield has nevertheless been realised, and the crop has averaged about 407 lb. per acre. The substantial rise in exchange, the fall in the price of Tea, and a reduced Coffee crop are answerable for the decreased returns as compared with the two previous years. The Company's Estates now have 1,489 acres of Tea in bearing, 102 acres in partial bearing, and 364 acres of young Tea which is coming on well. The remaining Coffee land is being gradually planted up with Tea. The re-arrangement of the capital of the Company referred to in last report was, during the financial year just closed, duly carried

out under the sanction of the Court. The shares are now of a denomination of £5 each, with £3 paid. The reduction of the liability for uncalled capital to £2 per share, in the opinion of the Directors, materially enhances their marketable value. The balance at the credit of Profit and Loss Account is £6,012-18-9, and the Directors propese to pay a dividend of 5 per cent. per annum free of income tax £2,250, of which two and-a-half per cent. was paid as an interim dividend at Whitsunday, 1898, and a bonus of 5 per cent. free of income tax £2,250, making £4,500, thus leaving £1,512-18-9 to be carried forward to next account.

THE PRUNING OF TEA BUSHES IN SOUTH INDIA.

ELSEWHERE we give the comments of an experienced planter on "Tea Pruning for the Nilgiris." Just as the proof of this reached us last week, we opened the *Planter* and found therein an article by a correspondent on "The Pruning of Tea Bushes in South India." It may interest our readers to compare the two, so we give the following copious extracts from the Calcutta paper:—

I have come to the conclusion that the young tea plant should not be allowed to rise above 3′ in height before topping, as no corresponding advantage accrues by permitting it to exceed this standard; then when the bushes have become shrubby, they should be cut across, at from 18″ to 20″, the growth thus resulting being unchecked, except in the case of fully developed shoots, rising above that level, which may be carefully tipped by coolies furnished with measuring sticks of the requisite length.

At this stage it is of the greatest advantage that the growth of the young plant should be as much unchecked as possible, the object in view being to get the bush into shape, more than that of showing an early yield of leaf.

It is also a desideratum that the lateral branches should be permitted to attain the height of the centre of the bush, prior to the sides being touched with the knife or plucked.

As regards the height at which such a plucking may be performed, it is impracticable to lay down any absolute rule, so much depending on the vigour of the bushes and on climatic conditions. Shoots left too long are inclined to become "*Banji*" and to remain stunted for some time; it is obvious, therefore, that they should be tipped before this occurs, but on the other hand, the more vigorously these shoots develop, the finer the ultimate yield: practically, it will be found wisest to tip the shoot at 30″ or rather less, and to pluck the leaf about that height from time to time.

Such treatment should insure the bushes having, by the time they are 2½ years old, a supply of vigorous shoots of young red wood which have risen from the original 20″ level topping. I think that heavy pruning of tea should be avoided as much as possible, except where such drastic measures are imperative, and in order to avoid such treatment of the young plants it is necessary to modify the system obtaining, of allowing bushes to grow for over three years before being topped: it may be taken as an axiom that the younger the tea, the less the check it experiences from a first pruning.

At the end of the fifth year, a comparison of the result of critical pruning at 12 months old, and of the same operation at three to four years, will demonstrate everything in favour of the former rather than of the latter system.

For the foregoing reasons it should be the object of the planter to postpone heavy pruning as much as possible, an appreciable advantage being gained by an early topping in the young wood; the postponement of the work till the third or succeeding year, when the stem has thickened, being attended with the risk of the formation of a "snag" in the bush which may subsequently set up "dry rot," and which every succeeding imprudent use the knife may accentuate, with enhanced decay in the branches.

With systematic pruning, between one and four years old, a well-shaped and formed bush will be produced, furnished with vigorous lateral branches, which with judicious keeping would continue furnishing fine shoots, and in the fifth year enjoy a more favourable position prospectively than a bush which at a similar age possessed the defeat of "snags," "dry rot," and its attendant dangers, accruing from a topping and pruning the preceding year.

These views are applicable to young properties, but with old estates more drastic measures are called for, especially where the bushes are suffering from the effects of continuous heavy pruning to maintain the yield.

I consider that a great deal may be achieved by the careful moval of diseased wood as well as by a rest from plucking, both to prove the bush and to facilitate its return to good plucking conditi With this object one great advantage is secured by merely tippi the centre of the bushes, allowing the outside shoots to mature i strong brown wood, subsequently operating on these and reduc to the pruning level with the knife.

By following this procedure the renovation of old tea has b accomplished, and further maintained by the retention merely of t thickest of the brown wood and removal of the whippy shoots whi only absorb the sap, and furnish very little leaf in return. I ha no doubt but that leaf formed on the stout healthy brown wood superior in quality to that grown on a sickly shoot; a considerati of the functions of the leaf and its power of elaborating sap w explain my meaning.

Under certain contingencies, I advocate regular, and, if necessa severe pruning, supported with manure, to bring neglected bush into order, every precaution being taken to avoid indiscrimina slashing, and to have careful manipulation and scientific use of t knife. In carrying out such work, great damage may result fr exposure of the primaries, the blistering of the bark, and destructi of the combium, followed by dry rot, unless the season is carefu selected.

The condition of the bush which from many years of pruning a sparse manuring has degenerated into a collection of snags, a with, as a result, a retarded and uncertain flow of sap, offers sco for what I believe to be the most effective means of resuscitating i powers; and under such circumstances, "collar pruning," proper conducted, has proved most successful in Assam and in Ceylon.

As regards "collar" pruning, this correspondent remarks th there seems to be no doubt that the section should be made about couple of inches below the surface of the ground, and that the woun should be immediately earthed over.

STATISTICS OF CINCHONA CULTIVATION.

THE Officiating Director-General of Statistics gives, under da 1st inst., the following two tables as presenting the facts concernin cinchona cultivation, the first in detail for the two years 1896-97 an 1897-98, and the second in abstract for the twelve years endin 1897-98:—

AREA.

At the end of the official year 1897-98 there were 4,346 acres land under cinchona cultivation, of which nearly 68 per cent. w situated in Southern India, the remainder (about 32 per cent.) bein in Bengal. The area in Bengal, comprising 1,394 acres, lies in an near Darjeeling. Most of the area in Southern India is in th Nilgiris and Malabar, there being 1,708 acres in the Nilgiris; 57 in Malabar, 361 acres in Travancore, 303 acres in Mysore, an 8 in Coorg.

In Bengal the land under cinchona was in the main planted an is maintained by Government, the plantations of the State coverin 1,384 acres. In the Madras Presidency, on the other hand, th industry has lain to much the largest extent in private hands, th State plantations covering under 800 acres.

During the twelve years ending with 1897-98 the area unde cinchona has fallen from 14,491 acres to 4,346 acres. There ha been a substantial decline in Bengal as well as in Madras, and i Coorg the cultivation has been almost entirely abandoned.

The number of plants in permanent plantations has fallen in th same period from 28⅓ millions to a little under 5 millions. In 1897-9 a little over 3½ millions were classed as mature and nearly 1 millions as immature plants.

The general reason for the decline is the fall in the price o quinine, which left but a small margin of profit in the productio of the bark for export. Last year, however, prices rose considerabl and the quantity exported was nearly ten times greater than 1896-97.

PRODUCTION OF BARK.

The quantity of bark collected fluctuates from year to year. Bu so far as the figures relate to Southern India, they have been great understated, being in every year, except the years 1895-96 and 18969 smaller than the quantities recorded as exported thence to cou tries out of India. Last year the quantity exported and purchase by Government from private plantations was more than 2¼ millio

pounds in excess of the recorded private production. The figures for Malabar, which relate to only a few plantations, are chiefly at fault, as there the export exceeded the recorded yield by more than 2 million pounds. In Bengal practically all the bark produced is manufactured by Government into febrifuge and sulphate of quinine and issued in that form to medical stores and hospitals, or sold to the public. The decrease in the production of bark in the Government plantations in Bengal is stated to be due to the fact that large quantities of bark were purchased from private growers, and it was considered advisable, under the circumstances, to harvest a smaller quantity of bark from the Government plantations in Sikkim than would otherwise have been the case.

BARK COLLECTED (LB.)

Years.	Madras.	Bengal.	Total.
1885-86	344,158	223,010	567,168

1897-98	3,056,769	...	3,056,769
Average ...	1,892,228	11,216	1,903,444

Of the bark collected in Bengal in 1897-98 more than nine-tenths (310,715 lb.) were collected in the Government plantations, and practically all was used for local manufacture. The Government cinchona factory produced during the year 10,148 lb. of quinine sulphate and 4,075 lb. of cinchona febrifuge.

COFFEE IN ASSAM.

THE following "Communicated" paper appears in the *I.P.G.*:—

Amongst the many auxiliaries proposed and discussed in planting journals from time to time, coffee would seem to offer itself as being well worthy of being placed in the front rank amongst the most promising by-products which have been brought forward as being likely to act efficiently as a stand-by to tea during a period of the latter's temporary depression. That coffee will grow and bear far heavier crops year after year, both in Upper Assam and Sylhet, has been well noted for years past in certain circles. It has been advised that coffee planting in Assam should be first carried out experimentally, and on no extensive scale, until success is placed beyond dispute. In South Sylhet and Assam we have known coffee bushes giving good average crops for the last 14 years. Those average crops would be called extraordinary crops in the coffee-growing districts of Southern India. From reliable information and personal knowledge those bushes still continue to bear heavily, and are in the best of health. This, we would think, would place coffee growing in the districts named far beyond the experimental stage. We must remember that 100 acres are a large average for a coffee garden in India and Ceylon, and this fact makes coffee so eminently suitable as a support to the larger staple. Coffee, as a by-product for the large tea companies of Assam, always appears to us ridiculous; if these companies are unable to stand by tea alone, then the latter industry in Assam is in a sickly way indeed. No, where coffee will come in is as a stand-by and support to private tea gardens, which, in fairly good times, can make headway, but which during a period of depression, if for any lengthened period, are bound to succumb as so many gardens of this type are succumbing at the present time. We know some of those gardens which have most suitable land unopened, which, if planted out in coffee a few years back, would most undoubtedly have prevented them going to the wall.

The want of elevation has been brought forward as an argument against the successful cultivation of coffee in Assam and its sub-districts, but we would ask our planting friends to bear in mind that although elevation is desirable—as a matter of fact absolutely essential—for the cultivation of the so-called Arabian variety in a pronounced tropical climate, it is by no means essential or even desirable in the climate of Assam or Sylhet. As far as the coffee shrub is concerned, the climate as it exists in those districts of Assam and its sub-districts, where the rainfall comes anything between 80 and 120in. is eminently suited for its successful cultivation. Hitherto we have been confining ourselves to the Arabian variety, but it ought not to be forgotten that there are other species well worthy of claiming our attention. Some hybrids we have now in cultivation which are not so delicate and particular as to the kind of soil in which they are planted. This is authoritatively stated to be the case with the Maragogipe variety, which grows to the size and of the same robust habit as the Liberian species with as big a berry, but of superior favour, and a heavy cropper. Then we have the Liberian species itself, which is essentially a low-level grower. The London market is against this coffee, but not so the American or Continental. The Straits Settlements plantations have gone a long way towards getting this coffee a bad name owing to the slovenly way it has been cured—or rather not cured at all—and put upon the market. In many cases the coffee arrived in a filthy, black state and covered with mould, which could not be expected to bring other than the very lowest prices. On the other hand we are assured that a well cured and properly graded Liberian coffee will bring from 45*s.* to 50*s.* per cwt. In that case a 50 acre block of well cultivated Liberian coffee, when we take its enormous yield into consideration, must pay most handsomely.

Another low-level West-African variety of the Arabia type is Coffee stenophylla. This variety combines all the qualities of the Coffee Liberica with those of Arabica, and at the present time by all accounts is systematically being put on the market as best "Mocha." Although we are perfectly well aware of a few starts which have been made in coffee growing in the South Sylhet District, this district can never become a large producer, and we would think all the better for those who have started, as there is less to fear from disease in a thinly populated district than a congested one; and we are inclined to think that this equally applies to the vegetable as to the animal kingdom. The land suitable for coffee cultivation in the South Sylhet district must be comparatively limited; still, as we have stated above, it does not require a large area of land to make a paying coffee garden as it does in tea. Blocks of land from 200 to 300 or 400 acres can be found which would produce two-thirds suitable for coffee growing, but in these days who would ever think of taking up such a block for tea cultivation? Again we would urge private gardens to make a strong effort if they have land suitable.

It has been asked time after time if any one could advance reasons why coffee would not prove a successful venture for South Sylhet. Every enquiry has been made from scientific men, as well as from practical coffee planters, not only in India, but in other coffee-growing countries, and we lay the results before our readers for their consideration. Judging from what has been stated, we would be inclined to think that the Assam or Sylhet coffee planter has a

great deal on his side and we cannot see that there is much against him; but it ought always to be borne in mind that the shrub will most likely require a slightly different treatment to what it requires in Southern India or Ceylon. But this, like all other things, is a knowledge only to be acquired by practice, observation and study. We may say in conclusion that South Sylhet grown coffee ranks in value with that grown in the Wynaad, and comes nearer in resemblance to the Mysore type than it does to any other.

THE U. P. A. S. I.

AS VIEWED FROM BOMBAY.

THE *Times of India* writes:—It is a pleasant custom, of five years' standing now, for the planters of Southern India to gather together once a year in Bangalore, and there discuss matters affecting the industry in which their capital is invested, and in the pursuit of which their lives are spent. Pleasant, we say advisedly, for Bangalore, with its elevation of 3,000 feet above sea level, is usually looking at its best in August, and chastened by the temperate monsoon, its climate, without much exaggeration, may almost warrant a local application of Tennyson's somewhat hackneyed line. Anyhow, the "sweet half English Nilgiri air" rises suggestively to one's thoughts. Moreover, the varied social functions that are just then in full swing help not a little to ameliorate the severe attitude of thought necessary for discussing such elusive matters as ladybirds, or such stonily impracticable subjects as roads and communications, or the currency, or scale pests, or coffee stealing, or the ravages of that cheerfully industrious parasite, the *Hemeleia vastatrix*. Not only, then, is the custom with which the name of the United Planters' Association of Southern India is identified a pleasant one, but it is a profitable one, inasmuch as the Association has given to the views and wants of planters a publicity, coherence, and solidarity certainly not possessed in years gone by. The meeting, which took place in August last, extended over four days, and the proceedings, as is usual, we believe, have now been issued in permanent form. Delegates from Central Travancore, Coorg, Kanan Devan, Lower Pulneys, Nelliampathies, Nilgiris, North and South Mysore, the Shevaroys, Travancore, and Wynaad were all present, some nineteen planters in all, and in addition to these Mr. J. Cameron, the well-known Superintendent of the Mysore Government Gardens, contributed some highly-interesting information regarding seed fertilisation, hybridisation, and the fertility of coffee generally. The everlasting currency topic bulked largely in the discussions, but apart from its undeniable importance, currency is a dismal bore, whereas a few facts and opinions about ladybirds and their relations to coffee—except, perhaps, to an overworked entomologist—appeal at once to the imagination. Because, as Mr. H. O. Newport, a planter of the Lower Pulneys, cheerily observes, *Rhizobius ventralis* is "a very good sort," and so too is *Orcus Australasia*, and if these are not good enough, there is *Cryptolœmus montrouzerii* to console anybody who feels a little disappointed. And Mr. Newport, though not a professed entomologist, ought to know, for he has been all the way on a special mission to the Agricultural Department of Queensland to find out. It would appear that while snakes and tigers and mosquitoes and scorpions are scattered over India, with quite a prodigal luxuriance, the ladybird is a comparative rarity—or at least that that species of *coccinellidæ* which feeds on "scale pest" is not easily forthcoming. This is all the more annoying, because it is precisely this species our planters want to get hold of. And as we have to import machinery, and packs of hounds, and trout ova, and British soldiers, so it seems the planters are compelled to import ladybirds, that is, when they can so manage to do. For, apparently, it is a great deal easier to get a shipload of Maxim guns into India than one small case of *Cryptolœmus montrouzerii*. Then, too, the ladybird, like our own domestic poultry, lays but few eggs, and as might be expected from their unconscionable names "they have many natural enemies." Mr. R. Gompertz, a well-known planter of the Shevaroys, suggested as an alternative the importation of eggs, but, apparently, a cargo of "great auks" would be more within the bounds of possibility than the microscopic ova of the ladybird. In the first place it seems it would take a year or eighteen months of study and work before eggs could be procured at all. So deposes Mr. Newport. Then "the eggs are so minute that you could not find them." Here we seem confronted with a quite insuperable obstacle, but Mr. Newport has an entomological kind of flanking movement in serve. "You would have," says he, "to collect the ladybirds, them on plants with scale pests on them, and let them go through whole course of their lives." There is obviously no telling wh long-lived ladybird might be up to, and Mr. Newport certainly not illuminate this part of the subject. "Then," he continues, " would have to examine minutely the leaves of the plants themselve collect the eggs." That sounds simple enough and encouragin far as it goes, but Mr. Newport's crushing conclusion is "that fin you would have to collect such an enormous quantity of eggs at time that the possibility of the scheme seems out of the questi And what about the imported article—the ladybird in bulk s speak? Mr. Newport, it seems, brought out his ladybirds f Queensland in ice, and he dolefully admits "the insects looked they ought to come out alive, but I could get no sign of life ou them." And this after capturing no fewer than 4,300 odd. almost tragic to read how Mr. Newport, when he got back to In tried to "resurrect" his importations. At last he "left them in the sun, but they only dried and were very evidently dead." much for these unfortunate *coccinellidæ*. It may be that better will wait on future efforts. In the course of the discussion on disease, Mr. Graham Anderson mentioned an extraordinary phe menon in connection with the pepper vine on some of the clearin In planting pepper, straight trees up which to train the vines desirable. The *Myristica magnifolia* is just the kind of tree for purpose, and as it grows wild all over the forests in South Mys the planters naturally thought it just the thing for their purp But the tree has a funny peculiarity. It is extremely gregariou habit, and will only live in clusters in the fores. "Immediately began to thin them out," says Mr. Anderson, "the others supp ing the pepper began to die out too." Gregariousness in tr it may be pointed out, is not exactly an unknown phenomen Whether it be an evidence of "plant intelligence" may be ope argument, but anyhow in this case, at least, the nature of the frustrated the intention of man. Mr. Cameron's warning t unless coffee planters turn from the error of their ways—in agricultural sense, of course—the Nemesis of eventual sterility overtake the plantations, will, perhaps, frighten some of Southern Indian friends into crop rotation, cross fertilisation, all the rest of it. Not that these things are unknown, but it wo seem that more attention might be given to them than is now the c For the rest it may be said that whether the U. P. A. S. I. conc itself with the encashment of currency notes, or the making roads and communications, or the building of railways, or the sil question in regard to tea, or those other more interesting top here briefly glanced at, it may fairly claim to well fulfil its spe object, while being at the same time a useful addition to the rep sentative communities of the country."

OUR INSECT FRIENDS AND FOES.

AT the suggestion of the Secretary, U.P.A.S.I., reprint, for general information and reference, the conte of Circular No. 7, Series I., dated 11th June, 1898, issu by the Royal Botanic Gardens, Ceylon:—

INSTRUCTIONS FOR COLLECTING AND SENDING SPECIMENS OF PLANTS AND INSECTS FOR REPORT.

Large numbers of specimens of plants for identification, pla attacked by insect or fungus pests, and other specimens, are c stantly received by the staff of this department. Much labou often wasted over these for want of knowledge on the part of senders as to what should be sent, and how it should be packed, this Circular is issued with the object of giving a few instructi on these points.

1.—DIRECTIONS FOR PACKING AND TRANSMITTING INSECT PESTS FOR REPORT.

Packets, said to contain "Insects for Report," are frequen received by the Government Entomologist with the contents q unrecognizable.

The chief consideration is that the specimens should reach th destination in as fresh a condition as possible.

As a general rule this can be best ensured by putting them i a close-fitting box. In this way leaves, and the insects feed upon them, can be kept quite fresh for several days, or even a we But do not spoil the effect by punching air-holes in the lid of

box. Insects do not require much air, and the supply that is enclosed with them in all cases will be ample for their needs. The free admission of air will only result in the drying up of the leaves and the possible escape of the insects; or the specimens may be injured by the jagged edges of the tin where the holes have been punched. If the objects consist of blighted leaves, it is particularly important that they should arrive in perfectly fresh condition. When withered and dried up, many leaves, particularly those of the tea-plant, become quite black, and any peculiar spots or characteristic markings are obliterated or rendered indistinct. Leaves and shoots of plants will keep fresh a longer time if gathered early in the morning.

For small parcels, an ordinary tea sample box will answer the purpose as well as anything. For larger specimens, or a larger supply of them, an empty tobacco box, or small biscuit tin, will be found useful. If it should be necessary to send large pieces of stems or branches that cannot be conveniently packed in a tin box, they should be nailed up in a close case in such a manner as to prevent the possible escape of any of the insects or respread of the disease.

An ample supply of the material should always be sent, and this should include examples in as many different stages as can be found. It is not always possible to identify the insects locally; in such cases a duplicate set of specimens has to be forwarded to some specialist in Europe, where large collections and good zoological libraries are available for reference. It is also intended to make up a collection of economic insects for exhibition in the museum of the Pradeniya Gardens. It is therefore particularly requested that ample material of any insect pests, as they occur, may be sent in.

Care must be taken that the specimens shall not rattle about loosely within the package during transit, which would result in their being bruised or otherwise injured. This can be prevented by including a sufficient number of leaves and twigs to support them. The object extreme—the overcrowding and consequent crushing of the contents—should be equally avoided.

Carboard-boxes or empty match boxes are not recommended, as leaves and young shoots soon become dried up in them; but if they should be used, a separate label should be attached for the stamps and to bear the brunt of the postmark. Packages sometimes arrive completely crushed for want of precaution.

It should be remembered that a broken package, or one that permits the escape of any of the contents, is a source of considerable danger. A most serious pest or disease may be widely distributed by this means.

Careful notes should be made and sent with each parcel, giving:—

(1) Locality and elevation at which the pest occurs.
(2) Date of first appearance; particulars of progress.
(3) Nature and extent of the injury.

To prevent any possible confusion between packets arriving by the same post, the name and address of the sender should be written on a corner of the label.

In conclusion, stress should be laid upon the important points:—

(1) Send the specimens in as fresh a condition as possible.
(2) Do not make holes in the boxes for ventilation.
(3) Send an ample supply of material.
(4) Do not risk the spread of a perhaps dangerous pest by sending an insecure package.
(5) Send full and precise particulars of the disease.

E. Ernest Green,
Honorary Government Entomologist.

2.—SENDING PLANTS FOR IDENTIFICATION.

It is very difficult to recognize many of the specimens of plants sent for identification, as the most important parts—the flower and fruit—are omitted. The specimen should always include, if possible, flowers, fruits (ripe, or nearly so by preference), and a branch with both young and old leaves in the case of a tree or shrub, or the whole plant in the case of a herb. A small piece of the surface bark is also useful in the case of trees.

If the journey is longer than twelve hours, and always by preference, the specimens should be sent in a tin box, tightly closed, and the name of the sender should be written outside.

In the case of plants found growing wild in Ceylon, notes should be sent of the locality in which they were found and of any other points of interest. If the plants are from abroad, the country from which they came should be mentioned if known, as the labour of identification is lightened if this is known.

3.—SENDING FUNGUS PESTS FOR REPORT.

Specimens of plants with fungus pests upon them should be most carefully packed in tin boxes or tea lead to keep them fresh, and to prevent the disease being spread by means of the packages. They should be despatched as soon as gathered, and if the journey be long, other samples may be sent in alcohol (dilute whisky or arrack will do). Full notes should be sent of the time of appearance of the disease, its ravages, what parts it attacks, the causes to which its appearance is supposed to be due, the results of any preventive or curative measures tried, and so on.

If the pest attack the leaf or bud, send fresh specimens showing as many stages as possible, with the necessary explanatory notes; also send a few healthy specimens of the same variety of plant from the same neighbourhood if possible. If it attacks the stem, cut out diseased pieces in as many stages as possible, to whatever depth the fungus penetrates, and send also some healthy pieces.

(Sd.) JOHN C. WILLIS,
Director, Royal Botanic Gardens, (Ceylon.)

PRODUCE AND PLANTING.

Widening Markets for Tea.

As was pointed out in Messrs. Gow, Wilson's circular last week, the foreign markets for tea are widening. This is especially the case in regard to Ceylon teas, the shipments of which have increased from 11,911,213lb. for the first nine months in 1897 to 17,037,941lb. for the corrrsponding period this year. The most important progress has been made in the Australian, North American, and Russian markets, and considering the material increase in the exports of tea from this country during the period, it is pretty evident that the consumption abroad is becoming a more and more important factor in the tea trade. It has already, it is stated, caused a substantial reduction in the supply to this country, and it is the earnest desire of those who wish well to the tea industry that the tastes for both the Indian and Ceylon articles will continue to grow.

Tea Planters and Their Coolies.

Tea planters will appreciate the championship of the *Globe* in the matter of the lying reports so freely circulated about the way coolies on tea gardens are treated. "As in Ireland, so in India, 'patriots' of the political variety vehemently denounce," says the *Globe*, "any encouragement given by the Goverument to migration from congested districts to areas where additional labour is badly required. The native papers in Bengal teem with this spurious sentimentality; according to their showing, the migration of coolies to the tea gardens of Assam, Cachar, and Burmah should be instantly suppressed as a very bad form of slavery. Every planter is pictured as a Legree who treats his workpeople without the slightest regard to their rights as British subjects, paying them just as much as he pleases, and exacting from them almost unintermittent labour. So blind, too, is the white tyrant to his own interests that he makes no provision for medical attendance or medicine, with the result that his miserable chattels die off like flies. Other stories of an even blacker character affecting the coolies' wives and daughters are freely ventilated; in fine, every tea plantation is an Inferno into which whoso enters leaves hope behind. Of course, the truth is exactly the contrary; there may be abuses here and there, but unprejudiced natives who have personally visited the gardens bear witness that the coolies are immeasurably better off in every way than they were before they migrated."

Last Week's Tea Market.

The quantity imported of Indian teas being large, the market is liberally supplied with a good assortment, says the *Produce Markets Review*, referring to last week's tea sales. The improvement in the demand, however, keeps prices steady on the whole, the lower grades being especially firm. This is attributable to the comparatively limited supply of other low-priced teas; but, as the proportion of the imports of these kinds from India is large, there is no reason for any decided rise in values at present. The low prices in Calcutta have no doubt led to heavier exports of common kinds to other markets, but as large supplies of teas of this class, especially from the Sylhet and Cachar districts, will be forthcoming, there is not likely to be any material curtailment in the supply for some time. There has been a somewhat firmer tendency for the more desirable medium sorts, and, as these offer exceptional value, a considerable business has been transacted in them, and there is a probability of their being dearer rather than cheaper later on. The fine and finest descriptions met with a steady demand, but, as most of

those brought forward are of a lower quality than those offered a short time ago, prices have correspondingly declined; the few parcels of stand-out teas, however, have realised full rates. The supplies of Ceylon teas brought forward have been on a rather larger scale, but in no instance has there been any decline from last week's rates, and the bidding throughout the sales was particularly brisk, prices in some cases being slightly dearer. Pekoes from about 7½*d.* and upwards were decidedly stronger, but not materially higher, while medium broken teas were also in much demand at very firm rates. The kinds least affected have been the common descriptions, but no alteration in their values can be quoted.

A PLANTERS' PARADISE.

Puertorico is clearly a pleasant place for tropical agriculturists. The *Times* correspondent gives an interesting account of its possibilities, and the United States Government will make the most of them. The conditions for sugarcane cultivations are not unlike those found in Jamaica. The present production of sugar in the island is about 80,000 tons, and of this amount 60,000 tons are available for export. Under favourable circumstances, such as the admittance of the products of Puertorico duty free into the United States, the export of sugar could be easily increased to at least 200,000 tons, and the capital necessary to bring about this development in the planting industry would be very speedily forthcoming if the conditions to coffee cultivation offered a somewhat stronger attraction to the possessors of limited capital than sugar-cane planting. Fertile forest land suitable for the formation of Coffee plantations can be purchased at rates varying from £2 to £3 sterling an acre. The expense of cultivation may be taken at £7 to £8 sterling for each acre planted until the trees begin to yield a return in the fourth year. Puertorican coffee has always brought very high prices and does so to-day in spite of the over-production of the bean in Brazil and elsewhere. At present the total exports of coffee from the island amount to some 25,000 tons annually, and this quantity might easily be doubled, or even trebled, if capital was available for the extension of the industry and more attention was paid to the methods employed in the cultivation of the plantations—difficulties that should now be easy to overcome. Tobacco cultivation also offers very considerable scope for increased production. One of the most serious questions in connection with tropical agriculture must always be the supply of labourers available for work in the fields. If numbers are any criterion to judge from, Puertorico must be considered exceptionally favoured in this respect, the population of 900,000 giving a density of more than 240 to the square mile.

THE MANUFACTURE OF QUININE IN JAVA.

We referred in our issue of June 3 to the experiment entered upon in Java, where it was resolved to establish a quinine factory. Java produces about two-thirds of the world's supply of cinchona, and it has for years been regularly shipped to Holland, where it has been sold by public auction. The large quinine manufactories which are mostly situated in Germany supply themselves with the raw material in the Dutch market, and of late years the manufactures have combined to keep the prices at such a low level as to render the cinchona cultivation unprofitable, although the manufacturers of quinine have been earning larger dividends. To meet this combination it was resolved to establish a quinine factory in Java, and this has been done at Bandoeng, where the first Java quinine has been produced. This, the last consular report mentions, is described as of excellent quality, and equal in all respects to the best European brands. Some of the planters were tempted early last year by the rise of prices in Europe, consequent on the establishment of the factory at Bandoeng, to consign their cinchona to Europe rather than to their own factory; but more recently they have seen that this course must result in the destruction of their own factory, and now the latter is being well supported with the local raw material. Some large shipments of Bandoeng quinine have been made to London, and smaller ones to other parts of the world, and the future of Java quinine will depend on the result of these ventures. Last year the total production of cinchona in the island was over 8½ million lb. avoirdupois.—*H. & C. Mail.*

THE CULTIVATION OF TEA IN INDIA.

THE Director-General of Statistics has published the following paper on tea cultivation in India:—

AREA.

The area under tea in India at the end of 1897 extended over 493,710¾ acres, nearly two-thirds (62·7 per cent.) being in the va of the Brahmaputra and Surma, which contain as much as 31 acres, namely, 179,160 in Assam (the Brahmaputra valley) and 13 in Cachar and Sylhet (the Surma Valley). In extent of cultiva Bengal comes next, though the acreage is smaller than in eith the divisions of Assam, the area under tea being 128,067 acre 25·9 per cent. of the whole.

The cultivation of tea is, therefore, to the extent of nearly n tenths (88·8 per cent.) of the whole area, limited to the two Provi of Assam and Bengal.

The other tenth is divided between Northern and Southern In thus:—

	Acres.
Northern India—	
North-Western Provinces... ...	... 7,965
Punjab	... 9,970
Total	... 17,935
Southern India—	
Madras	... 6,335
Travancore and Cochin	... 30,076
Total	... 36,411

The principal localities in each Province where tea is grown these:—

	Acres.
In Assam.	
Surma Valley:	
Cachar	... 61,190
Sylhet	... 70,200
Brahmaputra Valley:	
Sibságar	... 70,368
Lakhimpur	... 55,560
Darrang	... 33,984
Nowgong	... 12,659
Kámtus	... 5,873
In Bengal.	
Darjeeling	... 55,822
Jalpaiguri	... 65,072
Chittagong	... 4,024¾
Lohárdaga and Hazáribágh ...	... 3,049
In the North-Western Provinces.	
Kumaun	... 3,159
Dehra Dún	... 4,806
In the Punjab.	
Kángra	... 9,970
In Southern India.	
Nilgiris	... 5,479
Travancore	... 30,009

There is a small area of 747 acres in Upper Burma, but in Province the leaf which is produced is not made into tea, b pickled to be eaten by the Burmans, and the area and produc may therefore be left out of account.

There are also a few small areas in Goalpara, the Nágá hills, the Khási and Jaintiá hills, in the Chittagong hill tracts, in Si Malabar and Cochin.

Tea cultivation in India has been mainly concentrated in t where a heavy rainfall and a humid and equable climate perm repeated flushes and pluckings of the leaf. In the valleys of Brahmaputra and Surma the yield averages about 408 lb.; an Bengal about 381 lb., the yield in Jalpaiguri (the Duars) b 517 lb., and in Darjeeling about 239 lb. Elsewhere the yiel much lower.

The area under tea has expanded from year to year without a p during the thirteen years comprised in the second of the tables. 1885 the area was about 284,000 acres; in 1897 it had increase 493,710¾ acres, the increase being in the ratio of 73·9 per cent. largest expansion last year occurred in Travancore, where the cul tion of tea appears to be largely on the increase. The planters v however, unwilling to furnish information, and the recorded fig are quite unreliable. Thus, although the area under mature pl and the labour force are shown to have increased three-fold, quantity of manufactured leaf is returned at just half the figur the previous year. There were also considerable increases in Be and Assam, and a slight increase in the Punjab and the No Western Provinces. Madras shows an increase in 1897, and cul tion is said to be increasing in the Malabar District, but the fig which fluctuate from year to year are not reliable.

The number of acres added to the tea-growing area each has been:

	Acres.		Acres.
1886	14,294	1892	12,432
1887	14,584	1893	20,970
1888	11,524	1894	4,688
1889	9,374	1895	15,190
1890	11,126	1896	17,396
1891	17,610	1897	60,430¾

The average addition in the last five years (23,735 acres) was nearly double the average addition (12,413 acres) in the five preceding years. The increase in 1897 was at the rate of 13·9 per cent.; in 1896 the increase was at the rate of a little more than 4 per cent.

The plantations vary greatly in size. In Assam, where the industry is mainly carried on by Europeans with ample capital, where fusions of estates have been carried on for some years in view to economy of management, and where most plantations have large unplanted areas attached to them, the area of a plantation averages as much as 378 acres. In Bengal the average area of a plantation is 246 acres; in the North-Western Provinces the average falls to 101 acres, while in the Punjab, where natives grow tea extensively in the Kangra Valley, there are less than four acres to each plantation. In Madras the average is about 61 acres. In Travancore the area of a plantation averages as much as 448 acres, but, as stated above, the statistics for this State are not reliable.

PRODUCTION.

The quantity of tea produced has increased in the past thirteen years in much greater ratio than the area under cultivation, for, while the area has increased by 74 per cent., the increase in production has been 115 per cent. In 1897 the production in Assam, where the season was on the whole unfavourable, decreased by 2½ million pounds, but this was compensated by an increase in Bengal and the other British Provinces. The figures for Travancore, which, as already explained, are obviously erroneous, are thus responsible for the decline in the total production.

Representing the area and production in 1885 by 100 in each case, the ratio of increase in each compared with that year is stated below, the actual increase of production each year over the production of the preceding year being also stated:—

	Area.	Quantity produced.	Actual increase annually in lb.
1885 ...	100	100	...
1886 ...	105	115	10,899,835
1887 ...	110	129	9,826,270
1888 ...	114	139	7,540,462
1889 ...	117	149	7,250,331
1890 ...	121	156	4,993,531
1891 ...	127	173	11,831,496
1892 ...	132	170	— 1,873,628
1893 ...	139	185	10,253,626
1894 ...	141	188	2,465,144
1895 ...	146	200	8,694,783
1896 ...	152	218	12,617,847
1897 ..	174	215	— 2,643,846

PERSONS EMPLOYED.

The number of persons employed in the tea industry in 1897 is returned at 560,341 (permanently, and 101,980 (temporarily), or altogether about two-thirds of a million people (662,321 persons), which would work out to about 1·34 persons to the acre.

EXPORTS AND CONSUMPTION.

The tea produced in India is exported, mainly to the United Kingdom, to the extent of about 96·96 per cent. of the average production. The subjoined figures give approximately the quantity of tea consumed in India, the figures representing the average of the last five years:—

		lb.
INDIAN TEA ...	Produced	144,115,407
	Exported	139,776,797
	Left in India	4,338,610
FOREIGN TEA ...	Imported	7,418,538
	Re-exported	4,356,113
	Left in India	3,062,425

Ceylon provides India with a million pounds of the foreign tea imported, the bulk of the imports being Chinese. Of the 7⅓ million pounds left in India, 4⅓ are Indian and 3 are foreign. Part of this may represent stocks in hand, and the exports across the frontier by land, which are but imperfectly recorded, may be understated. More than a million pounds are purchased annually for the British Army, and a larger quantity must be consumed by the European and Eurasian civil population. In relation to the population of the country, the quantity consumed is infinitesimal, and the use of tea by the native population is practically limited to a small minority in the larger towns.

As stated above, the principal market for Indian tea is found in the United Kingdom, as will be seen from the figures appended, which state the quantity exported (in lb.) in the last three years:—

	1895–96.	1896–97.	1897–98.
By Sea.			
To United Kingdom	123,947,369	135,456,884	137,655,857
Persia	3,188,099	1,993,823	1,464,394
Russia	486,255	457,634	689,271
U. States and Canada ...	989,065	1,607,731	1,523,236
Australia	6,774,652	6,155,895	6,792,654
Trans-frontier.			
Kabul, Kashmir, and other countries on the N.W. Frontier ...	1,195,264	1,499,120	868,560
Other trans-frontier countries ...	6,048	13,664	18,144

PRICES.

The prices of tea in Calcutta have fluctuated greatly since 1873. Taking the price in March, 1873, to be represented by 100, it appears that until 1885 the level was well above that point, varying from 110 to 148. In that year, coincidently with the great fall in exchange and in general prices, the level fell to 90, and a low level was maintained in the following years until 1895, when there was a rise again to a high level. In the last three years, however, there has been a further decline in price. These figures all represent the course of prices of Fine Pekoe in January of each year as given by the Bengal Chamber of Commerce. The level for each year from 1873 is stated below:

1873	...100	1882	...126	1891	... 81
1874	...123	1883	...110	1892	... 71
1875	...123	1884	...116	1893	... 87
1876	...136	1885	... 90	1894	... 52
1877	...148	1886	... 90	1895	... 97
1878	...135	1887	... 77	1896	... 84
1879	...129	1888	... 84	1897	... 64
1880	...126	1889	... 77	1898	... 61
1881	...135	1890	... 63		

In the Statistical Bureau, the average prices of the various descriptions of tea sold at the public sales held in Calcutta during the tea season have been computed for some years past, and the results are regularly published in the review of the trade of India. From these returns of prices the figures below are taken, being the prices in annas and pies per pound of the three descriptions which form the largest proportion of the tea sold:—

	Broken Pekoe.		Pekoe.		Pekoe Souchong.	
	AS.	P.	AS.	P.	AS.	P.
1889 ...	9	9	7	5	5	7
1890 ...	8	10¾	7	2	5	8¼
1891 ...	8	7½	7	0½	5	3⅛
1892 ...	11	3⅓	8	9	6	5¼
1893 ...	9	2⅘	7	2⅔	5	4⅘
1894 ...	11	8	9	4⅘	7	2⅝
1895 ...	9	0	7	3⅘	5	11
1896 ...	8	7¾	6	9⁹⁄₁₀	5	5¼
1897 ...	7	5⅝	6	0¾	4	10⅔

DISTRICT ASSOCIATIONS.

NELLIAMPATHY.

PROCEEDINGS of a Meeting held at Victoria Bungalow, Wednesday, November 2nd, 1898.

PRESENT.—Messrs. Denny, Everington, Foster, C. Hall, Murray, Welchman, J. C. Abbott (*Honorary Secretary*), Mr. J. B. Burnett in the *Chair*.

Read Proceedings of last meeting.

Medical.—Read letter from the Hon. Secretary to the Medical Officer to the Cochin Government and his reply stating that he fully endorsed the view of the Association as to the importance of providing an Apothecary for the Hills, and opening a dispensary at once, and that he had addressed Government on the subject. He further suggested that as a precautionary measure against plague, it might be advisable to have coolies coming to the district examined at Nemmara.

It was resolved that the Association does not consider this at present necessary, and that the examination at Nemmara would not be effective, as many coolies came to the district through British Territory and thus would escape observation.

Read letter from the Hon. Secretary to the Dewan asking that an Apothecary be appointed and a dispensary opened at once.

Read the Dewan's reply stating that he concurred with the Association and had requested Dr. Coombes to appoint an Apothecary and open a dispensary as soon as possible.

Read letter from the Secretary to the Dewan stating that the offer of two acres of land as a site for the hospital, kindly made by the owners of Poothapara Estate, was accepted with thanks, and requesting the Hon. Secretary, N.P.A., to communicate with the owners for effecting a speedy transfer, as orders had been issued to the Chief Engineer to take charge of the site.

Bazaar.—Read letter from Messrs. Burnett and Son calling attention to the dangerously insanitary condition of the Nelliampathy Bazaar, and asking the Association to take action about this. *Read* the Honorary Secretary's reply stating that the condition of the Bazaar had been frequently brought to the notice of the authorities, and although this had usually resulted in its being roughly cleaned up at the time, it had very soon been allowed to relapse into its former filthy state. *Resolved* "That the Honorary Secretary should again write to the Dewan and ask that some steps be taken to keep the Bazaar in proper order, and that one or two coolies be kept at the Bazaar to attend to this. That if the Government would not sanction the necessary expenditure, it should be met by the Association."

Telegraph.—Read letter from the Superintendent, Madras Division, on the subject of opening a Combined Office at Nelliampathy, and stating that a guarantee of Rs.1,550 per annum would be required from the Association. *Resolved* "That the matter be allowed to drop, as it would not be possible to guarantee the amount required."

Lady-Birds.—Read letter from the Honorary Government Entomologist, Ceylon, to the Secretary, U.P.A.S.I., giving an account of an experimental consignment of Lady-Birds which he had received from the Cape by letter-post, and which had proved partly successful.

Classification of Coffee.—Read correspondence.

Roads.—Read letter from the Acting Chief Engineer saying that the road through Karapara should have his attention, and asking if any planters in the district would be prepared to undertake the maintenance of the Sircar roads.

Mr. Hall stated that although work had been commenced some time ago on the Poothoondoo Bridge, it was still incompleted, and that nothing was being done to it at present, consequently the road remained blocked to the great inconvenience of some estates. *Resolved* "That the Honorary Secretary should address the Dewan on the subject, and call attention to the general condition of the roads and bridges."

A vote of thanks to the Chair terminated proceedings.

(Signed) J. BURNETT BURNETT,
Chairman.
(„) J. C. ABBOTT,
Honorary Secretary.

WYNAAD.

PROCEEDINGS of a General Meeting held at Meppadi on 2nd November, 1898.

PRESENT.—J. W. Hockin (*Chairman*), R. Lamb, C. C. Lance, W. MacKinlay, B. Malcolm, B. Nelson, H. Powell, F. Robinson, G. Romilly, A. Trollope, and E. DeFonblanque (*Hony. Secy.*)

Proceedings of last Meeting.—The Proceedings of the last meeting were taken as read.

Pudu Padi Hotel.—Read letter from Mr. T. J. Ferguson enclosing cheque for balance of Pudu Padi Hotel Fund. *Recorded.*

Proposed by Mr. W. MacKinlay, *seconded* by Mr. G. Romilly, that Messrs. J. W. Hockin, R. Lamb, and E. DeFonblanque form a committee with full power to settle the Pudu Padi Hotel question and pay the promised Rs.15 per month to C. Shangaram when they consider it advisable. *Carried.*

Roads.—Read letter from Mr. T. J. Ferguson on the subject of the Palapoy bridge.

Proposed by Mr. G. Romilly, *seconded* by Mr. W. MacKinlay, that a strong protest be sent to the District Board against their recent orders closing the traffic over the Paliboya bridge to loads exceeding three quarters of a ton, and that this Association sugg that the simpler remedy would be to build a temporary bridg sufficient strength to carry the usual traffic.

Plague.—Read letter from the Collector of Malabar on the sub of the site of a plague camp between the 16th and 17th milestone the Meppadi-Choladi road. *Resolved* that the Association appr of the site for a frontier plague camp. *Resolved* that Mr. T Ferguson be requested to send the Association a copy of pamphlet on plague detection and prevention to be printed in Proceedings,

Non-Service of Warrants.—Read letters from the Superinten of Police on the subject. *Recorded.*

Coffee Robbery.—Read letter from Superintendent of Po *Recorded.*

Sale of Estates for Arrears of Revenue.—The Secretary was structed to ask the Collector to have the sales of Estates printe English as well as in Malayalam.

Tea Crop Estimate.—The Secretary was requested to collect mates of the tea crop of the district for the coming year.

A vote of thanks to the chair closed the Meeting.

E. DEFONBLANQUE,
Hony. Secy., Wynaad Planters' Associa

[APPENDIX.]

FROM
THE MEDICAL OFFICER TO
COCHIN GOVERNMENT,

TO
THE HONORARY SECRETARY,
Nelliampathy Planters' Association,
Nelliampathy.

SIR,

I have the honour to acknowledge receipt of your letter of 30th and to inform you that I fully endorse the view of the Nelliamp Planters' Association, and have addressed Government on the portance of providing an Apothecary for the Hills and openi dispensary at once. On hearing from Government, I shall comm cate with you again.

2. It is difficult to suggest precautionary measures against pla for the Nelliampathy Hills, but I think it would be advisable to the coolies examined and certified to as free from plague by Apothecary in charge of the Nemmara Hospital before they pro up the Hills, and if your Association finds this arrangement feas I shall be glad to issue the necessary orders to my subordinate.

3. For your information I have drawn up the following s and symptoms which may be regarded as typical :—

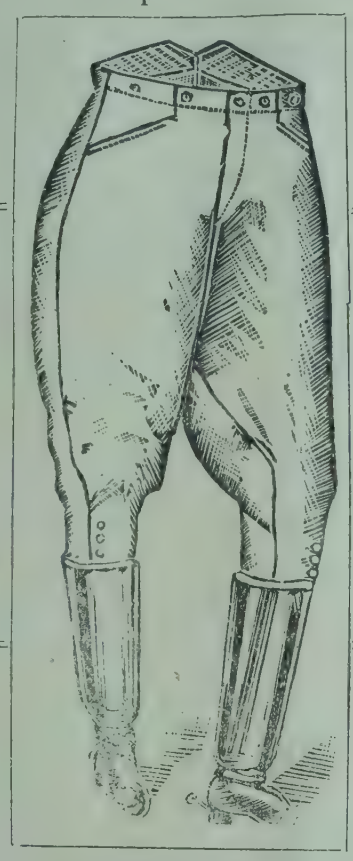
A rise of temperature on the first day of the disease of a very nounced character, 106° or more being common, accompanied severe shivering and frequently vomiting. In 95 per cent. of cases the conjunctivæ are found to be injected on the second da the disease. The tongue may be described as being like w leather, or of a rusty brown "typoid" appearance with red or inflamed edges. When spoken to, the person answers in a s hesitating, indistinct manner, the syllables being separated from another, and the impression conveyed being that the individu under the influence of alcohol. The gait is also in many cases gestive, being like that of a drunken man. Some cases, on the o hand, may present violent maniacal symptoms, or the man answer in an irritable manner as if resenting being questio But the typical appearance is the stupid, dazed look of one n awakened from a deep sleep, and there is evident difficulty in re ing new surroundings, and understanding what is going on aro Vomiting or diarrhoea, or both, may be present or not. Bu should, of course, be carefully looked for in the groins, armpits, maxillary regions, and in fact in all places where glands are kn normally to exist, as they are sometimes found in most unexpe spots.

4. Should plague appear, it will be necessary for your Associa to purchase a supply of lymph from the Plague Research Lab tory, Bombay, for inoculation purposes, and I shall be glad to p my Apothecary at Nemmara on Special duty to carry out treatment.

5. The plan of treatment pursued in Bombay is the followin Stimulants, good nursing, and the treatment of symptoms as arise. For a high temperature cold water over the head sponging of the body. Phenacetin and Antipyrin are found

BREECHES TRADE.

Breeches-making is a *specialité* with us. **Mr. Smith,** the proprietor, deals with every pair, and we warrant turning them out to satisfaction as regards fit, style and workmanship.



OUR SPECIAL:

MILLERAIN

KHAKI TWILL

8/8 BREECHES.

Putties 8 ft. long Rs.2.

Box Cloth Leggings Rs.9.

Newmarket Leather Leggings Rs.12.

Read this letter; it will convince you that we *can* make Breeches. **Mr. H. S. Dickins,** of Yercaud, writes: "*The Breeches received; they fit me perfect. I can, with confidence, recommend you as Breeches Makers to all my friends. We get our kit from Bombay, and have to pay about double your price.*"

ERNAKULAM,
6th October, 1898.

MARKET REPORT.

COFFEE.

Messrs. Wm. Jas. & Hy. Thompson's Report of the Colonial Markets for the Week ending October 26th, 1898, says :—Bank rate 4%, Bombay Exchange closes at 1s 4d. Brazil Exchange $8\frac{7}{16}$d. Rupee paper $3\frac{1}{2}$% $61\frac{7}{8}$. Silver $28\frac{1}{16}$d per oz.

A dull tone continues to prevail at auctions, the moderate supplies being chiefly bought in. The small proportion of good, however, continues to sell well. Brazil markets are again lower.

Futures have been flat throughout the week, but at the close a slightly firmer tone has prevailed, prices still shewing a decline of about 6d per cwt., viz. :—Good average Santos in Havre, December delivery, fcs. 36.75, in Hamburg pf. $30\frac{3}{4}$, and No. 7 low ordinary Rio in New York $5.25.

Daily receipts averaged 10,800 bags in Rio, and 24,800 bags in Santos.

To-day's London official quotations are :—

	Oct.	Dec.	Mar., '99.	May.	July.
SANTOS ...	29/6	29/9	30/6	30/9	31/3

We quote :—

Ceylon, mid. to good mid.	101/@108/	Costa Rica, mid. to fine...	69/ @
Do. small to low mid.	79/ ,, 99/	Do. ord. to low middling.	37/ ,
East India, mid. to good mid...	70/ ,, 92/	Jamaica, good to fine ord.	32/ ,

Export an increase of ...	2,780	„
Stock an increase of ...	8,079	„

This week's auctions have passed off as under :—

JAMAICA.—Of 152 barrels offered only 15 barrels sold—Blue Mountain triage 68s 6d, good to fine colory 105s to 110s.

GUATEMALA.—Of 2,360 bags catalogued only about 200 bags sold—London-cleaned, smalls 33s 6d to 36s, peaberry 66s to 92s.

COLOMBIAN.—Of 4,093 bags catalogued about 1,500 sold—fine fine ordinary greenish and gray 50s to 56s ; London-cleaned, small 29s to 42s, damaged and dull soft mixed red 51s 6d to 58s 6d, low middling dull greenish 60s to 60s 6d, middling greenish colory 63s 6d to 68s, good middling and boldish colory 70s to 77s, peaberry 64s 6d to 78s.

GUAYAQUIL.—77 bags pale sold at 36s.

COSTA RICA.—Of 449 bags offered only 50 bags small pale sold at 31s to 31s 6d.

SALVADOR.—572 bags withdrawn.

VERA PAZ.—Of 716 bags offered 70 bags sold—triage 25s, small 37s, low middling 69s, peaberry 82s.

BRAZIL.—1,468 bags washed Santos all bought in.

Exchange $8\frac{13}{32}$d, previous day $8\frac{7}{16}$d.

Havre, Oct. 26.—Market firmer, Santos good average December opened at 36½f. and closed at 36¾f., March opened at 37f and closed at 37¼f.

Hamburg, Oct. 26.—Good average Santos December opened at 30½m and closed at 37¼m.

New York, Oct. 26.—Closing prices of No. 7 Rio were as follow :—

	Oct.	Nov.	Dec.	Jan.	Feb.
Oct. 26	5.05	5.10	5.25	5.35	5.40
Oct. 18	5.05	5.05	5.25	5.35	5.45

Oct. 28—At auction to-day the following were offered :—4 packages Ceylon, 88 bags East India, 100 bags Lahat, 11 packages Jamaica, 1,329 bags Guatemala, 97 bags Vera Paz, 898 bags Costa Rica, 234 bags New Granada, 144 bags Nicaragua, 691 bags Colombian, 249 bags Coban, and 329 bags Santos. The sales went off quietly at irregular and, as a rule, easier prices.

TO-DAY'S HAVRE AND HAMBURG COFFEE TERMINAL QUOTATIONS.

(Communicated by Mr. Edward Nauen.)

TEA.

CHINA.—A quiet trade is passing privately at about previous prices, says the *Record* of 28th ultimo. Auctions went off slowly, Congous being only bid for in a desultory manner, and Scented Teas were all hard to quit.

During the week 3,708 packages have been catalogued for public sale, and partly sold as under :—

half-chests Black leaf Congou, common 3⅞d to 4d, fair 4⅝d to 4¾d.
ditto Red leaf Congou, fair 4⅝d, Panyong 5½d to 5⅝d, Soomoo 6¼d.
boxes new make Congou, 5d to 7d.
half-chests Souchong 5d.
boxes Canton Scented Caper, medium to good medium 5d to 7d.
ditto Scented Orange Pekoe, medium to good medium 7½d to 8½d fine 1s 2½d.

INDIAN.—Public auctions were heavier, comprising 53,400 packages *versus* 48,300 packages in the previous week, and 46,300 packages at this time in 1897. Notwithstanding these ample supplies there was a steady all-round enquiry for useful and fine descriptions at firm to occasionally dearer rates, while parcels lacking point and strength were, on the other hand, somewhat neglected and ruled in buyers' favor.

Common grades, both leafy and broken, were taken up freely at fully former quotations, and medium with good cup often advanced ¼d per lb. Fine and finest, where no falling off in quality was noticeable, met with strong competition and realised high figures. A fair selection from South India, chiefly Travancore, was brought forward, but did not show any marked improvement on late arrivals.

For 37,500 packages on garden account 8⅜d per lb., was obtained, against 9⅛d per lb. for 34,500 packages, and 8⅝d per lb. for 37,800 packages in the two preceding seasons respectively.

Total printed for the month (including that advertised for 31st instant.)

1898.	1897	1896.
238,600 pkgs.	187,300 pkgs.	187,800 pkgs.

which will make rather over 50 million lb. of the crop disposed of to the end of October, contrasted with 47¾ million lb. to the corresponding date a year ago.

CEYLON.—The sales were rather lighter, amounting to 20,000 packages compared with 24,500 packages on the 18th instant and 19,700 packages in 1897. There was much unevenness in the bidding, particularly for the finest lines, but on the whole no material change was establshed. Good medium to fine Pekoes and Broken Pekoes were in demand and some full prices were paid for a few of the latter when drawing thick liquor at from 9d to 1s per lb. Common to fair sorts, suitable for the home and export trades, were wanted, and sold with a hardening tendency.

The average is slightly over 8½d per lb. On the 20th inst. it stood at 8¾d per lb. and 9d per lb at this date in 1897.

During the month the number of packages offered was :—

1898.	1897.	1896.
75,500 pkgs.	75,000 pkgs.	80,400 pkgs.
(Avge. 8⅝d per lb.)	(Avge. 8⅞d per lb.)	(Avge. 8¾d per lb.)

JAVA.—Nearly 1,100 packages of direct import occupied the attention of dealers, desirable breaks passing well, the 107 packages from Perbawatte bringing 9¾d per lb.

In October the following were catalogued :—

1898.	1897.	1896.
4,100 pkgs.	2,100 pkgs.	2,800 pkgs.
(Avge. 7d per lb.)	Avge. 7¼d per lb.)	(Avge. 6¾d per lb.)

Deliveries.

The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns, were :—

From 1st to 25th Oct., 1898.....15,389,427 lb.
„ „ 1897.....13,906,186 „

During the week the following have been printed for sale by public auction :—

	Sold. Pkgs.	Withdrawn. Pkgs.	Total offered. Pkgs.
India	48,115	5,236	53,351
Ceylon	18,511	1,481	19,999
Java	992	102	1,094
Total	67,618	6,819	74,437

Also 424 packages from second hands.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated October 28th, 1898, says :—

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1898-1899.	584,675 pkgs.	507,172 pkgs.	19,783 pkgs.
1897-1898.	574,436 „	540,402 „	18,379 „

53,563 pkgs. Indian
20,568 „ Ceylon
1,134 „ Java.
} Total 75,265 packages were offered in public auction this week.

The present position of the Tea industry seems to justify a somewhat more hopeful view of the market in the near future.

Regarding Indian Tea, the quantity expected is not appreciably in excess of that received last season; deliveries so far this season have exceeded imports, a most unusual occurrence, and are some 5,000,000 lb. ahead of the same months last year, while the heavy stocks which have so long depressed the market owing to their excess over those of the corresponding period in the previous year have at length been considerably reduced.

The table below shows that the average price of each district is lower than last season.

The latest estimate of the Ceylon crop is only 3 million pounds above last year. Owing to the rapid development in foreign markets the quantity available for this country will probably be 4 or 5 millions less; the stock in London is below the same date last year, while the average price is slightly under 1897.

Duty payments during last winter showed a considerable falling off, whether owing to increased use of cocoa, the Engineer's strike or other causes; but as yet there are no indications of the same influences being at work.

Taking all the above facts into consideration, and remembering the unusually low price to which the market has fallen, it seems possible to hope for some recovery before very long.

Indian. Although the week's auctions were the heaviest so far held this season, the market slightly hardened, all grades except medium kinds being in good demand, while a tendency to advance was occasionally noticeable in low priced Teas Quality from Assam, Darjeeling and Dooars is not equal to arrivals of a few weeks back. Sylhet and Cachar, although showing some little improvement over former Invoices below the average.

Total Tea sold on Garden account 1st June to date 1898, 417,456 pk av. 8·71d. 1897, 412,962 pkgs., av. 9·09d.

Ceylon. Bidding was strong for Teas for price and for medium gr up to about 9d., and the market in consequence very firm. Over t figure competition was less keen, and prices in several instances gave w especially noticeable in the case of higher class Teas.

Average for week 8.50d., against 9.03d., same period last year.

Ceylon Tea sold on Garden Account 1st January to date 1898, 939, pkgs., av. 7·69*d*. 1897, 923,952 pkgs., av. 7·72*d*.

	1898.	1897.	1896.	18
PEKOE SOUG. (Ordinary leaf; fair liquor) ...	6½d	6¾d	6¼d	
PEKOE. (Ordinary leaf; little twist; fair liquor) ...	7¾d	8d	8d	
PEKOE SOUG. (Rather bold leaf; indifferent liquor) ..	5¼d	5⅓d	5d	
PEKOE. (Somewhat bold leaf; indifferent liquor) ...	5¾d	6¼d	5¾d	

Java. The Teas sold well at prices fully up to late rates. 108 packa "Tjiboengoer" averaged 9¼d. per lb.; 107 packages "Perbawatte," 9 per lb.

[NOTE.—The exports of Ceylon Tea to Australia, for 1897, should h been printed in last week's circular as lb. 9,205,561, not lb. 6,205,561.]

COCOA.

Owing to the very dull tone no auctions were held on Tuesday, and private sales have not been very important, including only 500 bags Trinidad at 77s to 79s, and 100 bags Caraquez Guayaquil at 79s to 80s per cwt.

Import, Home Consumption, Export and Stock of COCOA in London are as follows:—

		1898.	1897.	1896.	1895.
Imports, B. P. ...	bags	114,126	105,341	115,061	117,141

IN AUSTRALIA.

The market all round remains firm. Indians have sold readily, the auction sales, except the Bucephalus and Fazilka, being especially active. Chinas continue in demand at the late advance, and all price teas sell readily. Ceylons very firm, and owing to the scarcity of tonnage from Colombo the market is likely to remain so.—*Leader*, Oct. 22, Market Report.

IN AMERICA.

New York, Oct. 12.—At the auction sale by the Montgomery Auction Company, on October 5th, 4,029 packages were sold. The new Greens brought low prices, but good figures as compared with recent prices obtained for old crop; 238 packages fine toasty liquor Fychow averaged, net 21.11c; duty paid. The H. C. Fair Extra Gun-powder brought 28c; fair first, 23c; off first, 21½c. Fair first Imperial, 25c; very good second 21½c; third 20c. Poor extra Young Hyson, 21½c. Siftings and off first, Young Hyson, 19c; second Young Hyson 20c; third Young Hyson, third Hyson and Twankay, 18½c. Basket-fired Japan, Good Medium, are worth 26c. A line of Nibs, old crop, sold at 17c. Old crop Congous, Medium Fully Medium, 17½ at 18½c; common 16½c. Old crop Foochow, gradi Fair, brought 20½c. The new crop Formosas were sold in bond. Lo grade showed an improvement of fully ½c per pound. An invoice of 5 packages Good to Fully Good averaged 13.98c; 545 packages Go averaged 13.72c; 506 packages Good averaged 13.52c. Quotations are: L Superior, 16c; Good, 13½ to 14c; Fair, 13c.—*American Grocer.*

PEPPER.

Black.—A further decline has taken place on the spot, fair quali Singapore selling at 4½d. For arrival a firmer tone is apparent; 100 to Singapore sold, near at hand 4½d, and October-December (s.) 4 9/16 d to 4⅝ per lb. 25 tons January-March 4 11/16 d.

At auction on Wednesday only 37 bags damaged were offered and sol

White is also easier on the spot, but dearer for arrival. For arrival abo 75 tons done—Singapore, Nov.-Jan. (s.) 8 1/16 d, Dec.-Feb. 8 1/16 d to 8⅛d, a Jan.-March 8⅛d; and Penang, Oct.-Dec. (s.) 7 7/16 d per lb.

At public sale 499 bags Singapore offered and 120 bags sold—fine bo 9d, good bright 8d to 8½d, good but partly shrivelled 7½d to 7⅞d per 30 bags Penang bought in.

Cayenne.—24 crates (containing two 28lb. tins) yellow Nepaul retir unsold at 1s 3d; 9d per lb. bid.

GINGER.

Cochin.—There is not the slightest improvement in demand, the mark being, in fact, *in statu quo ante.* Catalogues on Wednesday offered 1 cases 483 bags, of which 8 cases 85 bags sold:—medium and small rou cut, slightly mouldy, 42s, ordinary medium and small washed rough Cochi mouldy, 20s per cwt.

Japan.—There is very little offering, but a sale of 100 bags very heavi limed has been made at 17s per cwt.

African.—60 bags bought in at 24s per cwt.

Jamaica steadier. 99 barrels about half sold—good middling brig washed 76s to 80s, middling 70s to 72s, common small and dark 65s to 6 6d per cwt.

SEASON REPORTS.

Coorg. POLLI BETTA, *22nd Nov.—Weather.*—Mostly clear and chill, with some E. wind since last report. Some clouds last evening. *Crops.*—Crops came on with a rush at first Siddapur way, but they have stopped now. No picking begun Polli Betta way yet. Only a few scattered forward trees with any ripe on them. *Labour* plentiful. *Health* generally fair. *Prices* mostly easier. *Interesting Item.*—Mr. Cameron's lecture on 30th at 9 A.M.

S. E. Wynaad. DEVALA, *23rd Nov.—Weather.*—During June and July the monsoon was not favourable, as in the previous years sun and rain at intervals, but from August to 14th November the monsoon was very heavy; from the 15th instant no rain, and the frost set in; the planting that was done in June and July is suffering heavily from leaf-disease, shrubs planted during August and September are coming on vigorously. *Crops.*—Picking is starting in a small way, and a berry here and there is ripening up. *Plant-diseases.*—Leaf-disease here and there, but it is disappearing now, and no damages like last year. *Health.*—Very good, but the aborigines are in a great fear of the plague inoculation, and as soon as they see any strangers, they run away to the jungle. *Labour.*—Always plenty.

Lower Pulneys. *22nd November.—Rainfall.*—From 1st June to 20th August (81 days) was a season of severe drought on these hills; during this period we had only 11 days of rain, averaging in all 1·75 inches, the heaviest fall being 65 cents, the rest in light showers of 5 to 25 cents (of no account to the drooping coffee). From 20th August the rains set in steadily, with the following record:—August 20th to 31st, 6 days of rain registering 4·25 inches; September, 18 days of rain registering 12·45 inches; October, 21 days of rain registering 10·50 inches to November 22nd, 14 days of rain registering 8·15 inches. Here are two extremes,—the longest drought, followed up by one of the best seasons of rain. Of course, all estates have suffered more or less from the drought, some very badly indeed; the rains were all too late to be of any real benefit to these crops. From 16th to 21st November we came in for one of those delightful breaks in the N.-E. Monsoon which we all so much appreciate after weeks of damp, misty weather, when everything round one gets into a state of mildew and mess. Rain has set in again to-day, and for those of us who are busy picking it is anything but pleasant. *Crops.*—

Picking has set in steadily on most estates. I fear the quality of our coffee will not be up to the average: a drawback with a dull coffee market in view. *Cardamoms*—crops cannot be called good this season. *Plant-diseases.*—There is a little "leaf rust" about, but nothing of an alarming character. Green bug has disappeared from our coffee; it has undoubtedly done harm to the crop, but a mere nothing to the damage caused by drought. It is a remarkable and, at the same time, a most fortunate circumstance for us that this bug *entirely* disappears from our coffee at this season of the year; it gives our trees a chance to recover before next blossoming season. Can any of your readers give a reason for this mysterious disappearance of the green bug during our wet weather? I understand it is not so in Ceylon; in fact there the wetter the weather, the more prolific the bug. Black bug certainly does not disappear in this way. On the whole, coffee is looking remarkably well throughout the district. *General Health.*—Fairly good. *Labour.*—Sufficient for all requirements.

BRAZILIAN COFFEE.

RECENT pessimistic utterances concerning the prospects of the Coffee Market have led us to go somewhat closely into the facts concerning the production of Coffee in Brazil. This is the chief factor that influences prices, not merely because the Brazilian crops represent a very large proportion of the world's supplies, but also because they are freely operated in by speculators, who take little or no interest in such comparatively minor products as Indian coffee, or the West Indian berry and others. Now, it is certainly true that 1897 witnessed a very large crop of Brazilian coffee, so large that the year has been described as "in every respect extraordinary and exceptional" from the point of view of the coffee-planter in Brazil. Exclusive of transit, coffee entries for Rio and Santos were 10,032,101 bags, against 7,273,572 for 1896. An increase of nearly 38 per cent. in a year is a serious matter; but large as entries were, shipments tried to get level with them. In fact, the total shipped, exclusive of Ceará, from Rio, Santos, Victoria and Bahia, amounted to 10,431,184 bags. It goes without saying that unless consuming markets could show a large increase in offtake, prices must be depressed by shipments such as this. That demand had not sufficiently expanded to counterbalance the enormous growth of production, is shown by the fact that stocks had largely increased in all the chief markets of the world by the end of 1897. Before commenting on the effects of this, let us note what particular markets were most likely to be affected. The Coffee exported from Brazil in 1897 was shipped to the following destinations :—

	United States.	Europe.	S. America.	Other countries.	Total.
Rio ...	2,790,722	1,214,868	287,478	145,511	4,438,579
Santos ...	1,499,599	4,084,211	36,543	2,417	5,622,770
Victoria ...	287,619	76,621	...	5,595	369,835
Bahia ...	190,916	80,171	1,155	1,087	273,329
	4,768,856	5,455,871	325,176	154,610	10,704,513

Of the total, exports to the United States represented 44·5 per cent., to Europe 44·6 per cent. From this it will be seen that, roughly speaking, half of the weight of the additional production of Brazilian coffee fell on the United States, a market that is not very largely interested in Indian coffee. Of course, however, depression in the States reacts in other countries and indirectly affects the prices of Indian coffee as well as those of other description.

A few more words may be said as to the quant exported from Rio and Santos. They were :—

6,318,000	bags in 1895,	realizing	£22,500,000
6,991,000	„ „ 1896,	„	£18,227,000
9,685,000	„ „ 1897,	„	£18,500,000

so that with an increase of more than 53 per cent. in quantity exported since 1895, there was a decrease of a 18 per cent. in value. Certainly, this shows a terrible in prices, and up to this point our remarks may help pessimist. But this very reduction of prices has had the e of stimulating consumption. The misfortune is that the sumer does not feel the full benefit of it. Whenever he be to do so, there will without doubt be a rapid increa demand. The depression of Brazilian prices has not accompanied by a similar depression of Indian values : there has been nothing like the fall of price pointed to i figures last quoted. The reason is that speculator Brazilian coffee in the States were, for their own purp forcing prices *down*, whereas those in Europe were hol prices *up*. This had this consequence: that the Amer demand *was* stimulated by low prices, whereas the Euro demand *was not* stimulated, because rates did not fa severely. An instance was cited by a Rio de Janeiro temporary some months ago. A well-known house at I announced the sale of Brazilian coffee at *specially c rates, six francs per kilo.* Deducting the value of the Fr Import duty, 1·56 francs, the balance of 4·44 francs kilo was equivalent to 38 *cents* per lb., whilst the coffee was being sold in the States at 8 *cents*, or a 80 *per cent. less!* The more we study the figures that available, the more convinced we are that while Amer demand has developed largely under the stimulus of prices, there has also been a steady growth of deman Europe unaided by such stimulus. No doubt, this has partially due to the expulsion of adulterated and imita coffees, but it is at least a pleasant set-off against pessim statistics of increased production.

Now, we advance beyond 1897. The most recent adv state that the Brazilian crop this year is some 20 to 25 cent. less than last. This must have an effect upon pr Something may be said of a recent circular by Messrs. W CROSSMAN and BRO. of New York, in which they led public to believe that all other estimates of Brazilian c were being deliberately put at low figures, and that were therefore unreliable. As, however, it has since pointed out that Messrs. CROSSMAN'S estimate for 1897, m so late in the year as August 27, was 1,800,000 bags *b* the actuals, there is some room for doubt as to the accu of their recent high estimates for 1898. The simple f before us are, that there have never been three large c in succession; that demand is unquestionably expand and consequently that prospects are certainly not gloo than they were a few months ago. Although we have qu statistics, we do not ask readers to rely implicitly upon figures given. Making even liberal allowance for e however, we can safely assert that the statistical positio Coffee has gained, not lost, strength of late. We may remind our friends that India is not alone in its Excha troubles. Planters in Brazil have made much mor recent years out of the depression of Currency than been made by planters in India. Yet Brazilian plan also have the troubles of a fluctuating Currency to cont with, and if at times they gain while Indian plan

lose, the reverse must happen at times. It has happened recently, for early last month there was a rapid rise in Exchange at Rio. It opened on the Monday at $7\frac{7}{8}$ and closed on the Saturday at $8\frac{7}{16}$, a rise of over 6 per cent. in, one week! This was attributed to speculation; but be the cause what it may, the effect must always be that of making the income of the planter very uncertain. Broadly speaking, the chances of a rise in Brazilian Exchange are greater than the chances of a fall. But when we find the principal industries of Brazil standing to lose heavily by an increase in the cost of production owing to extreme tightness of money, and exports checked by a very sudden rise in Exchange, we must feel that the reaction against over-production has already set in, and that the pessimism that utters dark forebodings now is at least a day "behind the fair."

PLANTING IN NORTH BORNEO.

Our North Borneo contemporary gives Coffee "a very high character," saying that wherever the berry has failed to give a good return in the island, "it may be safely said that it is owing either to neglect or errors of cultivation." North Borneo is stated to be "slowly but surely emerging from the cloud of suspicion which has hung over it as a field for profitable enterprize since the early days when bad land selection and bad estate administration gained it so unfavourable a reputation in the neighbouring colonies." *Pepper* is giving a handsome profit (to Chinese growers). The gardens opened by the Captain China at the back of Sandakan are most flourishing, and as it is found to pay well, it is highly probable, if prices are maintained, that fresh pepper gardens will be opened in the West Coast. *Hemp* is doing well, and only needs machinery to make it a most profitable crop, and the same may be said of *Rhea*. Good reports are given of *Tobacco*. The Kinabatangan estates are using fresh ground, and the prospects of good crops are decidedly hopeful, as are those of the plantation at Lahat Datu. It is expected that the estates at Marudu Bay will yield an average of from 8 to 10 piculs. On Ranau Estate there is one kongsee which expects 19 piculs per field, (for about 36 fields, 17,000 trees planted per field.) It is anticipated that Ranau will give an average of about 15 piculs, Bandau 13, Bongon 11, and Tandek 10; there are hardly any caterpillars this year, and the tobacco is expected to be of high quality. All the above estates are about half plucked and half cut. Pitas Estate expects a crop of 8 to 9 piculs (12,000 trees to the field planted) with every promise of good quality; the whole crop has been plucked, but nothing cut. Langkom also is expecting a big crop averaging about 12 piculs and is all plucked. *Tapioca* cultivated by an energetic planter, late of Ceylon, in Marudu Bay has been valued on sample at the high price of $6 and will undoubtedly pay well. There is an ample choice of suitable land, tapioca being less exigent as to richness of soil than coffee or tobacco. And we see, by the way, that the Government advertises that it "is prepared to make a limited number of *free grants* up to 500 acres of land each for the cultivation of Tobacco." So North Borneo looks like a good field, with competent stewards to encourage entries.

SIGNED CORRESPONDENCE.

[Under this head, letters, replies and remarks will only be admitted if signed by the writer. The object is to promote the interchange of opinions, experiences, etc., between planters who are willing to support their remarks with their signatures.]

MANURES.

Storage of Cattle Manure.

Sir,—In sending my last, I hoped that the cattle manure side was disposed of, but the question of storage requires some consideration. In this there is an ideal method which I cannot at present carry out: I think it should be stored under a pucka roof on a pucka floor sloping slightly to a pit for drainage; this pit should be periodically three-quarters filled with soil to take up the drainings from the manure, and when cleaned out the soil should be added to the heap. Failing this, there are three methods commonly in use:—

(1) To leave the manure in the shed, adding fresh bedding thickly every day, and only cleaning out once in three months or so.
(2) Cleaning out frequently and storing in heaps.
(3) Cleaning out frequently and storing in pits.

If bedding is used, I think No. 1 is the best, as the urine is better saved, and I have found that if the place is properly bedded, no harm is done to ordinary cattle, but during wet weather great care must be exercised in the choice and supply of bedding. Of the other two, perhaps No. 2 is best in hot weather, provided the heap is thick enough to prevent undue dryage, and No. 3. in the monsoon to prevent waste by exposure to rain. In pits in the hot weather I have found cattle manure, especially if bedded with green stuff, turn mildewy and hot; this does not seem to occur to such an extent in heaps. Villagers generally keep their manure in too shallow heaps, and sometimes it gets dried to the consistency of very old bratties. I do not quite despise bratties, but take little trouble to collect them when I have no superfluous women and children, and last year only paid three pies per bushel for the small lot I did get. I once collected a large quantity, the year of which I have at ready written, when part of my manuring was delayed, and as already said to date see no improvement in the coffee.

Of jungle soil I have said nearly all that occurs to me; a partial analysis of scrapings from *inferior* scrub may be of interest. The scrub jungle was not burnt; I think it should be.

*Organic matter and combined water	... 14·[illegible]
Potash	... ·359
Lime	... ·360
Phosphoric acid	... ·171
Silica, &c., &c.	... 64·44

The analyst (Mr. Hooper) remarks: "This is a very good soil, it contains all that is necessary for ordinary plant food." Against this I give an analysis of *first-class* cattle manure (gram fed and bracken bedded and the manure well cared for) (*Mr. Pringle.*)

Moisture	... 25·83
Organic matter and combined water	... 55·23
Oxides, iron and alumina	... 1·11
Lime	... 1·50
Magnesia	... ·86
Potash	... ·89
Soda	... ·41
Phosphoric acid	... ·55
Sulphuric acid	... ·13
Chlorine	... ·24
Insoluble matter, sand, etc.	... 13·25

* Nitrogen ·252.

Now looking at these, I do not think the latter is worth more than twice as much as the former, and it probably costs four times as much, and common cattle manure is perhaps worth no more bulk for bulk than good topsoil. In considering the cost of cattle manure, frequently no allowance is made for interest on cost and the cost of new cattle to keep up the herd, for, as a matter of fact, I have generally found that the natural increase is insufficient to keep pace with natural mortality, the death-rate amongst calves being enormous, while in an epidemic such as we get very frequently, losses are very severe. Taking all in all, I think my cattle manure costs me six pies per bushel at the shed door without any charge for the trouble and supervision; for bought manure probably one anna per bushel delivered at the estate boundary is an average price, and very inferior stuff it is at times. Jungle soil can, I think, be loaded on a cart for two pies per bushel, but my recollection is not quite clear. The subsequent cost is much the same in both cases; if there is a difference in favour of jungle soil, it is a small one.

To my brothers in misfortune who have, no spare jungle, I say, "Let us experiment;" to the others I say, "Sell all your cattle kept for manurial purposes alone, and try scrapings." And yet I must make some allowances. No man can lay down the law for another in any one detail in this country, where a short distance may make a difference quite incomprehensible to an outsider. Herein lies one of the chief difficulties in the way of a general understanding; the matter of a few miles of convenient road, a few feet in elevation, a few inches of rain, the turn of a hill, the presence or absence of competition, and many other little things may be really important factors, though on the surface they appear trifles.

ARTIFICIAL MANURES.

But, Sir, this is all trifling; the truth is that, like the small boy who wanders along the edge of the water not daring to go in, I would rather wander on about bulk manure than plunge into the cold water of artificial manuring. However, we have got the words out, let us try to get on with the matter,—making a start with the old-fashioned, time-honoured mixture of bones and poonac. This mixture was, and indeed is still, supposed to supply nitrogen and potash with a trifle of phosphates from the poonac, phosphoric acid, lime, and a little nitrogen from the bones. Now in your issue of 16th July we were startled by an extract from the *Tropical Agriculturist* giving opinions of experts that the phosphoric acid in bone manure is so inferior in its effects when compared with either basic slag or superphosphates that one can only fix the value of bonemeal by the proportion of nitrogen supplied.

This sort of shock must drive us to consider the situation very seriously. Those who put forth all such theories may or may not be cranks—we have little chance of knowing, but their writings seem to meet with attention and sometimes more or less acceptance from writers in a better position to ascertain their standing, and their theories cannot be passed over by us as disproved by practice. Here is a mixture which is generally believed to have done yeoman's service for us in past years. Has half the money been practically thrown away? A very serious question. This is the sort of point on which we may hope to be benefited by the employment of an agricultural chemist. We don't expect him to cure leaf-disease, we have fought or dodged that more or less for perhaps forty years, and are not yet reduced to such a level that we cannot go on devising means to fight or dodge it, but we cannot fight increasing competition and a 40% export tax unless all unnecessary expenditure is abolished.

Of the various kinds of poonac, my experience has but a limited range, and the choice seems to me to depend very much on the respective prices and facilities for supply; hence locality may often be a determining factor. Here I use for choice white castor-poonac, which I have found successful; the black k is also good, but it seems doubtful if the somewhat lower asked for it compensates for the inferior analysis. I refer to stuff sold by coast firms, which is generally fairly well crush In common country mill produce, I have an even greater pref ence for the white poonac. It generally contains less oil is easier to crush.

An early addition to the old mixture was muriate of pota I know nothing of this salt, and as one hears comparatively li of it now, perhaps it was not a very great success.

More recently three (to us) new manures have been somew extensively tried, the nitrates of potash and soda and superph phate of lime; but I doubt if any one in my neighbourhood well qualified by experience to pronounce a verdict. I h made considerable use of nitrate of soda, and so far have b quite satisfied with the experiment. Quite lately I have tr superphosphates, and the fields to which it was applied l remarkably well, but sufficient time has hardly elapsed for a c to be affected unless it be in the quality of that now on the tr It was not until this season that I applied the nitrate of pota With the nitrate of soda I first tried application in the weather. The result was a very fine flush of wood, which quite unnecessary—I have seldom any lack of wood; but after monsoon leaf-disease was rather severe, and it did not app that the nitrate did any good. Later, I applied after monsoon, say in October, and have every reason to be plea with the last three seasons' work. It is probably due to t that I have almost driven leaf-disease out of the one field this place which always suffered to an extent which rendered a useless incumbrance, and it seems to me that the general t of other fields has improved. Now I hear that sulphate ammonia is even more successful, and hope to read someth about it soon in your columns.

I am trying a mixture which is, I believe, the one most in by those who have abandoned bulk manuring, viz., poonac, sup phosphates and nitrates, but have not had the experiment in ha long enough to be able to express a definite opinion.

Lime is a somewhat expensive and, in its unslaked state dangerous, though on some soils very effeetive, manure; wh well slaked, that is, I suppose, turned into carbonate of lime, effects are not so apparent, as it does not then act as a solvent digestive tonic, but I imagine that most of our soils will found defective in lime as a mere constituent of the coffee t and bean, and therefore its application must be desirable. Y have already insisted on care being used in its application wh superphosphates are employed. Can anyone tell me whether same danger exists in using bones and superphosphates togethe I presume that the superphosphates would be used up bef the lime in the bones becomes freed by decomposition.

I leave coffee planting without manure to such able ponents as Mr. Nelson and "Legume," from whom, I hope, shall see something about green manuring.

Now I think that the little I can do for you in answer to yo challenge is in your hands, and trusting to meet with a con derable amount of friendly criticism which will be of gene benefit,

SEAGULLY, MUDIGERE,
15*th November*, 1898.

I am,
Yours faithfully,
(Sd.) JNO. G. HAMILTON.

P.S.—I am sorry to see from your footnote to my last th you feel no remorse; in fact, you rather seem to enjoy my wr ings. It is distinctly low to chuckle over the victim of misplac confidence. There is one small slip, probably my own. In t second column, last para., third line, "out" should read "off

NOTES.

China's Exports of Tea. Up to November 4th the exports to United Kingdom from all China ports for the current season show a comparative decrease on last season of 1,300,000 lb.

Japanese Tea. The feature of the present tea season in Japan will be a considerable decrease in production. Improvement of quality is being strenuously urged upon planters.

Tea in Norway. It is reported that tea costs 5 to 6 kroners per lb. in Norway, and "good tea" 9 to 10 kroners. The duty is 2 kr. per kilo. Taking 18 kr. per £1, we have some grand prices!

The Tea Cess in Ceylon. The Thirty Committee has suggested the raising of the tea cess from 20 cents per 100 lb. to 25 cents. If this is agreed to, advertising and foreign campaigns will no doubt be prosecuted more vigorously than ever.

The Planters' Enquiry Committee. The Simla correspondent of the *Madras Times* states that a resolution on the subject of South Indian Planters' grievances will probably be issued "presently" by the Government of India. Hope deferred once more!

The Calcutta Tea Sales. On 18th instant 22,000 packages were sold. The bidding was brisk throughout. Broken pekoes were occasionally easier. The market otherwise was firmer, especially for pekoe souchongs. Darjeelings were in strong request. A fair amount of bidding by Bombay buyers and other outside markets took place.

An Agricultural Department for Ceylon. On the initiative of the Planting Member of the Ceylon Legislative Council, the Government has agreed to appoint a Commission to enquire and report whether an Agricultural Department should be formed for the prosecution of scientific research in matters affecting tropical agriculture.

Experimental Farms in Jamaica. Coffee, kola, cocoa, nutmeg, ramie and rubber are all being experimentally cultivated in Jamaica. According to the report of the Jamaica Agricultural Society, the farms are not remunerative or even self-supporting, but they afford to neighbouring growers an object lesson in more enlightened methods of tillage.

Tea and Coffee in New South Wales. The principal item in the Customs Revenue of New South Wales was the duty of 3*d.* per lb. on tea, which should yield this year £80,000. It is now proposed to levy a duty of 6*d.* per lb. on coffee, except in its raw state, when the charge would be 3*d.* The duty on chocolate and cocoa is 4*d.* a lb., on rice £3 per ton, and on sugar £3 per ton.

The British Tea Duty. At a meeting of the Indian and Ceylon Tea Association's joint committee held in London on 1st instant, it was resolved unanimously that it was inadvisable to take any action at present in this matter in the way of agitating for the abolition or reduction of the present duty, which bears much less heavily on British-grown tea than on foreign grown.

Theft of Prædial Products. At the suggestion of the Planters' Association, the Ceylon Government lately issued instructions for special vigilance in all districts where cocoa and all low-country products are cultivated. Similar orders on the part of the Madras Government in regard to Coffee-stealing would be very welcome if issued year by year just before the opening of the crop season.

Coffee in Selangor. The United Planters' Association over Selangor way has adopted the Selangor P. A's suggestion to send delegates of the Association to Java to investigate the methods of treating Liberian coffee adopted there with a view to improving the quality of the Selangor coffee. The S. P. A. contribution to the necessary fund is to be at the rate of $5 for each member, the whole amount to come out of the general surplus, and it is hoped that the Perak and Negri Sembilan Planters' Associations will subscribe similarly.

The London Tea Market. Reporting on 17th instant, Messrs. Gow, Wilson and Stanton cabled to Colombo that the market generally was unchanged, but good liquoring Broken Pekoes were easier. Fair liquoring Ceylon Pekoe Souchong was quoted 6½*d.* and the average of Ceylon Tea 8½*d.*, as in the previous week. It appears from Reuter that 17,000 packages were sold out of 19,000 offered, and that the average was 8½*d.*, a decline of ⅛*d.* Of Indian Tea 42,000 packages were sold out of 48,000 offered, the average being 8⅜*d.*, a decline of ⅛*d.*

Budding the Mango. The *Journal of the Jamaica Agricultural Society* for October remarks:—"Budding the Mango has been generally considered an impossibility, but this is a mistake because it is done by experts in Florida, and it can be done by others when understood. The secret lies in taking the buds from about the middle of the growing shoot where they are well developed, and yet not too tender—where the colour of the bark is just turning from green to purple—and at a time just prior to a vigorous stage or growth in the tree to be budded. The shield method has been used, but I believe the ring or plate style would be better." What say growers in India?

Tea Prospects in Ceylon. The *Ceylon Observer* says:—A planter, who travels a good deal over the tea districts, reports as follows:—"Every one is complaining of the weather. The ground is sodden, aud tea is not flushing so well as might have been expected after a dry August and September. Indeed, in some districts the yield in October and November will be very disappointing. The surprising thing is that tea is not higher in price, seeing that supplies have been falling short for some time past. I am afraid wholesale buyers and distributors and other Cheap-Jack people have done us a good deal of harm in the old country if only the truth were known."

Cheap Manures. The Curator of the Botanic Gardens, Towoomba, Australia, reports that ashes and charcoal must be classed among the most natural and economic manures that can be applied to plants. Fifty pounds of the ashes of an appletree, Mr. Harding calculates, will contain four pounds of potash, which must be the substance most largely absorbed by the tree. The power of the potash to liberate nitrogen from humus is well known, and this action in making available the nitrogen in the soil is strikingly shown when land recently cleared of timber is put into crop. Wherever a heap of logs or brushwood has been burned down, there the vegetation is rank and luxuriant.

Kolingi Seeds wanted. Some little time ago, Mr. Brasier, Acting Conservator of Forests in the Southern Circle, drew attention to the utility of the plant known in Tamil as *kolingi* for purposes of manure, and recommended that manure-yielding forests should be planted with it. The names for *kolingi*, as given in the dictionary, include the Tamil varieties of *nempali, vempali,* and *yampali,* together with the Telugu *hozhinnila.* Unfortunately, however, the dictionary affords no hint as to where seed can be obtained? One of our readers is anxious to plant the *kolingi* (*tephrosia purpurea*) on a fairly large scale, with a view to using the leaves as manure, when making a compost for his coffee-plants. Can any of our readers help him with information as to where the seeds are procurable?

Colombo Tea Sales in 1897 and 1898. The *Times of Ceylon* remarks that the local average obtained by the teas sold in sale at Colombo this year and last are worth comparison. For October and November the figures this year and last were as follows:—

	1897.	1898.
October 5th	36	... 37 cts.
„ 12th	39	... 38 „
„ 19th	41	... 38 „
„ 26th	40	... 37 „
November 2nd	39	... 36 „
„ 9th	35	... 36 „
„ 16th	36	... 37 „

Though the average the last two weeks has been higher than for the corresponding weeks last year on the whole, the average to date this year is about 2 cts. lower.

Queensland wants a Coffee Expert. The Cairns Chamber of Commerce recently read a petition signed by about 30 coffee growers in the Cairns district of Queensland, urging that Gove ment should appoint a coffee expert to instruct the co growers in the matter of pruning trees and preparing crop. The petitioners asked the support of the Chamb Mr. John Cairns stated that he was assured that a co petent man was then in Brisbane. It might be w to mention the fact to the Government. On being appea to for his views, Mr. D. R. Lewis, of the Mount Grah Coffee Estate, stated that the appointment of an expert w necessary to the success of the industry. But it wa matter that required care. Coffee growing in South India and Ceylon was an entirely different matter to cof growing in North Queensland.

Tea in the United States. The *American Grocer* remarks We must recognise that the flav and strength of British-gro machine teas are so different from China and Japan t that Americans must be educated step by step up to appreciation of their merits. They are not a tea-drink people, preferring coffee and beer, which condition is some attributed to climatic conditions; but whatever cause, there is abundant promise to the persistent advoca of Ceylon and India tea that every year will see increased demand. "We may not like them at first, but w before long." Not, however, if low-grade or trashy is forced on this market. Just so long as there is merit the teas of Ceylon and India, they are here to stay. T popular taste is fickle and varies in different sectio The Eastern and Middle States prefer fermented tea; Western and South-western, green or unfermented le and it is folly to attempt to force a change in the charac of the demand, except by intelligent and persistent effor

American Trade with Brazil. Consul-Gen. Seager, writing fr Rio Janeiro to the State Depa ment, gives some valuable inform tion concerning Brazilian resources and trade with t United States. In the last three calendar years the sh ments of coffee from Brazil were as follows:—

Years.	Bags.
1895	6,910,831
1896	7,481,761
1897	10,359,765

The Consul-General traces the causes of over-producti In the ten years prior to 1897 the market price afford an extraordinary profit to the planters, and there was enormous increase in the area of coffee plantations. N these additional millions of trees are bearing. For t next year a much smaller crop is expected, because expe ence shows that there will be a light yield after two c secutive heavy ones. Recently English, Belgian and oth syndicates bought coffee plantations in Brazil. So it d not look as if present low prices had scared capitalists aw from Coffee.

Combating Malaria. The Cajaput tree (*Melalen Leucadendron*) grows in malario swamps, and contains in its foliage much antiseptic a anti-miasmatic oil. According to the late Baron Sir von Mueller, Government Botanist of Victoria, it will gr where no Eucalyptus could be reared. It attains a heig of about 80 feet, with a stem reaching 4 feet in diamet on tidal ground; it can with great advantage be utili

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain per ton:—

61·50 lbs. Nitrogen.
57·38 „ Potash.
14·92 „ Lime.
13·68 „ Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the 1898-1899 crop of seed from the parent trees of above analysis at Rs.6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the

MANAGER, ARIENKOW ESTATE,
Shencottah.

in salt swamps for subduing malarian vapours, where no Eucalyptus will live. The lamellar bark protects it against conflagrations. The wool is fissile, hard and close-grained, regarded as almost imperishable underground, and resists the attacks of termites (white ants.) It is well adapted for posts, wharf-piles, ship building and various artisans' work. The foliage yields the well-known Cajaput oil, so closely akin to Eucalyptus oil. Mr. K. Staiger obtained on distilling the leaves as much as 2 per cent. of oil, which might be manufactured on a large scale from ample material in many parts of Australia. It is rich in cineol. Seedings can be obtained at the Kingston Public Gardens, Jamaica.

A Rival to the Lady-bird. Mr. A. v. d. Poorten lately sent the *Ceylon Observer* some leaves of Liberian coffee from Serdang, Sumatra. It appears that a large number of trees were attacked by green bugs. "Orange tips" are visible on the under-surface of the leaves, and one fortnight after the appearauce of these had been observed "all the green bugs on the plantation were dead." A planter writes:—"These orange tips are to be found on every tree where there is bug and everywhere large and small are dead." Mr. Green, Honorary Entomologist to the Government of Ceylon, after inspecting the leaves referred to, reports:—"The yellow fungus on the leaves is evidently a parasitic growth that has killed out the bugs. And it must have done very great service in checking the pest. Our local 'green bug' (*Lecanium viride*) is subject to the attack of another kind of fungus, of a greyish-white colour, which frequently destroys very large numbers of the insects; but a sufficient number always escapes to replenish the stock. I am keeping the leaf, and shall try to propagate this Sumatran fungus upon our Ceylon coffee bug. It may possibly prove a more effective check than the disease to which they are already subject."

Good Coffee. We are glad to see that in the Coffee Trade as well as in the Tea Trade good advice is being given to the consumer. A London firm of dealers, addressing residents in their district, state:—"We are in a position to supply coffee in perfection, blended from the finest Mocha, East India, Jamaica, Costa Rica, Ceylon, and other choice growths, roasted with the latest patent machinery by expert roasters. We recommend those customers who do not at present do so to buy whole berry, and grind only such quantities as are required for immediate use: suitable mills for grinding can be obtained at a comparatively small cost. There is probably no article which deteriorates so quickly as ground coffee. If the public would buy only fresh-roasted coffee, of good quality, from a reliable dealer, grind it only as required, and use without chicory, we feel sure that this article would soon vie with tea as a popular beverage. Where it is not convenient for customers to grind their own coffee, they may rely upon its being supplied by us fresh ground for each order." This is, as the *Grocer* remarks, the kind of information that the consuming public require. The wise retailer realises that buyers may be persuaded but that they cannot be coerced.

The Colombo Tea Sales. At the sale on 16th instant at Colombo about 7,512 packages= 641,548 lb. were offered, of which about 5,048 packages= 444,705 lb. were sold. There was a strong demand for all leaf teas, specially flavoury sorts, which fetched full rates, and in many instances showed an advance. Broken Pekoes were not so keenly sought after, and were very irregular and in some instances easier. Amongst the fine teas in the sale were:—Devenford, Glasgow, Naseby, Agra Ouvah, High Forests, and Iona, and amongst the low-country teas good invoices were offered from Freds Ruhe, Farnham, Rayigam, Pikande and Chesterford. The following results obtained by High Forest and Stamford Hill (Vogan Tea Co.) have been specially mentioned:—

HIGH FOREST.

				cts.
22	hf-chs.	Broken Pekoe	.. 1166	73
22	do.	Orange Pekoe	... 1012	71
24	do.	Pekoe	... 1056	54
27	do.	Pekoe Souchong	... 1161	41
95	do.	... ...	... 4395	

Average 60 cents.

STAMFORD HILL.

				cts.
33	hf.-chs.	Flowery Orange Pekoe ...	... 1650	71
15	chs.	Orange Pekoe ...	... 1350	50
8	do.	Pekoe ...	... 680	40

Average 58 cents.

One box of Digdola Estate golden tips, containing 5½lb., and one box of Flowery Pekoe, containing 6 lb., were put up for sale. The former realized R13 and the latter R3·50 per lb. One box of Hayes Estates golden tips containing 50 lb. was afterwards sold for R2·50 per lb.

LETTERS TO THE EDITOR.

THE GENUS BISON.

DEAR SIR,—I am sure Sportsmen in India would like to know the name of the recent writer on whose authority you wrote in your issue of November 5th, that throughout the whole world there are only two species of the genus Bison extant. What about *Bos gruniens*, the Yak? which occurs if not in India proper, at any rate on the very borders of it in the North.

I enclose my card and remain,

Yours faithfully,

16*th November*, 1898. GRUNTER.

MODEL FARMS SUGGESTED.

SIR,—I have read the article headed "Small Farming for Retired Planters," published on pages 488-89 of the *Planting Opinion*, dated 10th September, 1898. I am glad to state that the scheme is a proper one. In connection with dairy farming, &c., mentioned in the article, the following also may be added: Bee-keeping or agriculture, which includes the cultivation of such plants as produce flowers from which bees can obtain their honey. Pisciculture or rearing fish, which is the art of increasing the number of good fish in tanks and other bodies of water and preserving them from wasteful destruction. Kitchen gardening or the cultivation of vegetables for the table.

NOTHING EQUAL TO THESE IN THE CARNATIC.
[2-10-98—t.f.o.]

(This branch is very profitable, especially when it is undertaken near large towns.)

Sericulture or rearing of silk-worms, which includes the cultivation of the mulberry as a food for silk-worms. These are all branches of agriculture, and may be profitably undertaken under proper conditions by the Agriculturist.

As for the necessity of this art, it is evident enough, since this can live without all others and no other without this.

Although agriculture will be subject to losses from the effects of unfavourable seasons, yet many nations have lived and some do still without any art but this. A little ground will without question, feed a little family. Farmers are without dispute, of all men the most quiet and least apt to be inflamed to the disturbance of the commonwealth. Their manner of life inclines them and interest binds them, to love peace. Modern agriculture demands professional training of a most complete character; a thorough knowledge of the first principles of agriculture is of the utmost importance to the would-be successful farmer.

Agriculture in India at present is the reverse of "Modern,"

If Indian agriculture is to be regenerated it must be by the intelligent cultivators under qualified European supervision, aided by Government funds or by the capital of the wealthy gentlemen.

As the native farmers are very ignorant and superstitious, I recollect the proverb "Example is better than precept," and my suggestion is that our State authorities should be induced to establish a small model farm with all possible improvements somewhere near the centre of every collectorate and an annual prize to be given to the holder of a well conducted Farm.

P.K.R.N.

KINASHERY,
30*th October*, 1898.

GENERAL ARTICLES.

THE U. P. A. S. I. SECTION.

[UNDER THE CONTROL OF THE SECRETARY, U.P.A.S.I.]

Inquiries concerning Mr. Consul Fraser's recent report that *Copper*, not Silver, is practically the real currency of China, have elicited some very interesting information. The British Consul at Canton states that Consul Fraser's statement is substantially correct. It is true, he remarks, that in the treaty ports dollars of various denominations are current, but merely as representing a certain recognized weight of silver of a certain touch. The prices of the necessaries of existence, such as rice and other grains, are always quoted in copper cash. The value of silver in copper cash constantly fluctuates, and these fluctuations do not necessarily follow those of the gold market. Away from the treaty ports, large sums are paid in either silver sycee or ingots, as being more portable; but this is used by weight at the current rate of copper cash for the day. The land-tax is always expressed in copper cash, though for convenience the Government accounts are always rendered in taels, *i.e.*, Chinese ounces of silver. The authority whose statements are here cited adds that, in spite of the bimetallist theory, there can be no doubt but that silver has not kept its value in China as compared with the real currency, *i.e.*, copper cash. He remembers the dollar at over 1,100 cash. Lately in Shanghai it stood at 750. Its current value at Canton on the 26th ultimo was 950, which is a high exchange. T Chinese Government has of late found itself in a diffic position. The people will not accept copper cash exc at about its intrinsic value. Accordingly, when the mar for copper goes up, a vast amount of cash is smelted a used in manufactures, causing a scarcity. The Gove ment is thus forced to coin not infrequently at an act loss. No less than seven mints have been established late years in different parts of China. These mints t out dollars to a certain extent, but more largely subsidi silver coinage, the latter giving a larger margin of pro These pieces are gradually making their way into interior, but the smallest being the 5-cent piece is of too high value for the requirements of the masses, wh daily nourishment rarely costs more than that sum. Ma attempts have been made by Chinese officials to arbitra establish a fixed ratio between the cash and silver, these have always failed ignominiously.

It is clear from this, not merely that China, thoug silver-using country, has in reality a copper currency, also that, instead of benefiting by cheap silver, she actually suffering from the effects of dear copper. H far the currency troubles of the Chinese Government worthy of comparison with those of the Government India, is a matter that would appear to deserve much m careful consideration than it has yet received.

HONEYDEW.

IN the *Bee-keeper's Record* Mr. Brice combats the idea that th either a dew or a secretion from aphides. Microscopical examinat of thickly coated leaves of Lime and Sycamore revealed not m than three or four insects on some leaves, while an hour after, insects having been removed, the beads of honeydew were decide thicker than when first gathered. He concludes that certain atm pheric conditions charge the cells of some leaves with saccha matter, which, on a change of temperature, cannot be absorbed the ordinary channels rapidly enough. As a consequence there rupture of the cells, or a copious exudation through the pores of leaf. Aphides, of course, are attracted to it, and also bees. T fact that honeydew from the Oak and Sycamore is darker than t of the Lime proves that it partakes of the nature of the tree, no the insects.—ENTOMOLOGIST, in *Journal of Horticulture*.

MILLIE & REDMOND, late P. THOMPSON & CO., *Ootacamund, Engineers and Contractors.*

THE DURABILITY OF WOOD.

There appears, says the *Planter*, to be no doubt but that the durability of wood is affected by its position. The problem has puzzled many why two pieces of wood, sawn from the same section of a tree, should possess very varied characteristics when used in different positions. For example, a post will be found to decay much faster if the butt-end of the tree is uppermost than would be the case if the top was placed in this position. The reason is that the moisture of the atmosphere will permeate the pores of the wood much more rapidly the way the tree grew than it would in the opposite direction. Microscopical examination proves that the pores invite the ascent of moisture, while they repel its descent. To make the meaning more clear, take the familiar case of a wooden tub or bucket. Many have doubtless noticed that some of the staves appear to be entirely saturated, while others are apparently quite dry. This arises from the same cause, viz., the dry staves are in the position in which the tree grew, while the saturated ones are reversed. This is a point worth bearing in mind.

ACTION OF ELECTRICITY ON GROWING PLANTS.

Professor S. Lemstrom, in the Physical Science Section of the British Association, recently described a series of experiments on "The Action of Electricity on Growing Plants." After a brief sketch of previous experiments on the subject made in 1885 and 1886, he referred to the researches he carried on last year in the Estate Bridtorp with the friendly assistance of Baron Edward Hisinger, the proprietor. In general there was found in increase in the seeds of at least 40%, and the roots from 25% to 75%, depending on the kind of plant and on the nature of the soil. The experiment proved, among other things, that electricity given to plants during days when there was a clear burning sun might damage them very much if enough water was not also given at the same time. Discussing in what way electricity exerted an influence on plants, the author said that either the gases in the air were transformed to ozone and nitric oxides, which, being heavy, fell down upon the plants and increased the activity of their vegetation, or the electricity induced the juices of the plants to ascend more rapidly in their capillary tubes. Though much has yet to be explained, the method is ready to be used for practical purposes. Of experiments carried out in Finland this summer, the tobacco plant did not yield, in the earlier stages, to the favourable influence of the electric current, through want of water; but when watered and under the influence of the current, the results were about 40% better than without it. The current was applied for four hours in the morning and four hours in the afternoon, with many interruptions, however, from June 17th to July 30th. The total number of hours was 161.—*Produce World.*

COFFEE IN NORTH BORNEO.

We are glad to see that the *British North Borneo Herald* is not among those that take a pessimistic view of the prospects of Coffee. It says:—

"As regards coffee, we have always maintained that the alarming 'slump' in the home market would not be of a permanent nature. Recent home advices show that there will be a shortage in Brazilian and other exports, and although it will probably never again touch the high prices formerly ruling, it will still continue to pay careful and economical growers."

With reference to the progress of Coffee Cultivation in North Borneo, our contemporary remarks:—

Taritipan estate promises a higher yield than that of last year, in spite of the drought in last September and October which told so heavily against the trees then in heavy crop, and spoiled the chance of January blossom. This year's rains have better suited the cultivation. And Mr. Schuck expects that the 1899 yield will be about 900 piculs, which, as the price of Liberian coffee will probably be higher, should yield a handsome profit. There is by the way a very good chance of acquiring a well-planted coffee estate not far from Sandakan, as its elderly Chinese owner wishes to return to his native country, and but few of that nationality can or will go in for extensive planting. Wherever coffee has failed to give a good return, it may be safely said that it is owing either to neglect or errors of cultivation, and we hope before long to see this industry in a more flourishing condition.

INDIA-RUBBER IN CEYLON.

In his address to the Legislative Council on 7th inst., the Governor of Ceylon said:—

"The planting of Para rubber has gone on in the low-country, and the price of seed has risen very high in consequence of the great demand. Mr. Willis reports as follows:—'This bids fair to be a very valuable crop for suitable districts. A circular was issued in the early part of the year by this Department, giving details as to cultivation, yield to be expected, &c. Since that time the subject has been gone into very fully by Mr. Parkin and myself. Mr. Parkin is elaborating a very perfect method of coagulating the milk, which yields very good results at small cost. There seems every reason to believe that by the aid of the process the cultivation will prove sufficiently profitable to attract planters to take it up. The whole question of rubber cultivation has, however, assumed a new aspect in consequence of the discoveries of Mr. Biffen of Cambridge. By the aid of a machine on the principle of the cream separator, he can in a few minutes obtain the pure caoutchouc from the milk of any species of rubber tree, and the product thus obtained is practically identical, whether got from the Para, Ceara, or other species. The best results are perhaps obtained from the milk of *Castilloa elastica*, and it thus becomes a question whether the planting of this species should not be taken up in Ceylon in the dry parts of the hills, where Para rubber will not grow. The next few years will, I feel sure, produce remarkable developments in the rubber industry, and I should not be surprised if Ceylon were to become an important centre of it.'"

MANURE.

The Village Cultivator.

The *Planter* seems to think that Government will succeed in doing something in the matter of teaching the village cultivator how to improve his lands. We have our doubts: but, anyhow, this is what our contemporary says on the subject:—

The subject of the supply of manure in India is one with which the village cultivator is intimately connected. There is a great deal of evidence, both scientific and practical, to prove that Indian soils are uniformly very poor in two all-important particulars, namely, humus and nitrogen. There is the indisputable evidence of Dr. Voelcker as regards the poorness of Indian soils, that, whether exhaustion is in progress or not, their fertility is at a very low ebb. Close observation of the wages and methods of the village cultivator in all parts of India shows that but little care is bestowed by him in the conservation of the manure which he has ready to hand. For instance large quantities of cattle dung are carefully dried for fuel; the urine is wasted; there is no properly organised system of getting the night soil and other refuse matter on to the land. In these respects, it is palpably evident to every inquirer that a most serious loss is constantly occurring, and it is only reasonable to conclude that no cultivable land can be brought to anything like a high state of fertility when local conditions are so unfavourable. It is, therefore, a wise provision of the Government in the Agricultural Department to teach the ryot, by simple methods, how to turn his land to profitable account, and this is being done with persistent energy, so that we may look in the not distant future for results which will materially improve the present impoverished condition of the village cultivator.

TEA IN NATAL.

The *Natal Mercury* says:

"Five years ago one of our local tea planters stated that the acreage of tea in Natal should supply the requirements of the whole of the tea-drinking population in South Africa, and that within the next two or three years considerable quantities would be exported to London, where the success of Natal teas would have to be proved. The manner in which the trade statistics of the Colony are compiled makes it impossible to say how much Natal tea was actually exported, or where it was sent to, but in any case the local product has not as yet made a name in the London markets, nor is it yet exported in considerable quantities. Apart, however, from either the London or other foreign markets, there is a very big market in South Africa,

which has hardly yet been touched. During 1896 the Cape imported 3,000,000 lb. and Natal 1,148,000 lb., so that we are sure we are under the mark in saying that there is a market in South Africa alone for at least 5,000,000 lb. of tea, and in this market the Natal producer has advantages that neither the Ceylon, Indian, nor Chinese growers have." Our contemporary does not appear to think, however, that Natal is yet in a position to supply the markets opened up to it on such favourable terms. The *Mercury* urges the establishment of Planters' Associations with a view to the organization of schemes for developing the industry. It concludes:—"We have written in no spirit of depreciation of the industry. All honour to those who introduced it, and to many who amid difficulties have laboured to make it a success, but we cannot say honestly that after twenty years it has made the progress expected, nor that it has expended as fully as could be desired. Of late there have been signs that an era of improvement in the quality and the quantity of the tea produced has set in. The widening of the protected rea has been long desired by the planters. They have virtually got it enow and it remains to be seen whether having got it they will tak the advantage of it the colony has been led to expect, and so develop the industry that, like Ceylon, they will be able to go over the sea and enter the world's markets in open competition with all comers."

A FRENCH "KEW."

ACCORDING to the London correspondent of a contemporary, France intends to "take its cue" from England and establish a Gallic Kew Gardens. The account as to how this came about is amusing. It opens by referring to a note in the *Westminster Gazette* in which the Kew authorities are made to take a very lofty standpoint indeed as regards the introduction of British grown teas.

Some Frenchman has been interviewing the people at Kew it appears, and was so impressed with what he heard as to the part Kew had played, that he confided the result of his investigations to M. Trovillet at Paris, with the result that almost the last act of that Minister before leaving the late French Cabinet was to institute

A BOTANICAL GARDEN IN PARIS

for the experimental culture of coffee, tea, rice, cacao and other tropical products. His informant assured him that as a consequence of the experiments at Kew the exports of tea from India rose from twenty-three pounds in 1873 to the 200,000,000 lb. estimated at the present day. Now whether the Frenchman mistook the information he received, or Kew bungled the information it imparted, present deponent knoweth not, but it is plain the twenty-three pounds in 1873 must refer to the tea first sent from Ceylon in that year, for India's contribution ran into three figures at the least by that date, and if I am correct in supposing it is the Ceylon historic twenty-three pounds that are meant, then the French observer is in deeper water than before, for that tea was not made in consequence of any information or instructions from Kew, but as a result of an investigation carried on in India at, if I remember aright what I have heard, the instance of the Government of Ceylon on the one hand, and the Planters' Association on the other. Therefore, where Kew comes in is rather hard to make out, and anyhow if the French Government think they will introduce tropical industries into their colonies by showing in Paris how it can be managed, I am afraid they will meet disappointment. Half a dozen hard-headed colonists on the spot will beat twenty experimentalists at home, and in so saying I am not meaning to undervalue Kew, which has done plenty good work, even if the education of the Indian tea planter is hardly to be included in the category.

"ASSAM HYBRID."

IN reply to the question: "Assam Hybrid"—is the term a misnomer and is there such a thing as a hybrid in tea? a planter writes to our Calcutta contemporary *The Planter*:—

The term is a misnomer, and there is no such thing as a hybrid in tea. It may be considered a rash statement, but I have satisfied myself as to the fact. The popular idea is that the "Assam indigenous" is one plant, and the "China" another, and that these two species having been planted in close proximity have hybridised, the resultant being a hybrid called the "Assam Hybrid." Now, we must bear in mind that hybrids are extremely rare thi in Nature, and, where hybridising does take place, it is by artifi means. Bees and insects of various kinds are said to carry pollen from one flower to another, but who taught them to carry their work of hybridising so systematically, and carry the po from the China to the Assam? Why not from the Assam to China? If in the former case, the Assam crossed by the Ch results in "Assam Hybrid," in the latter it would be "Ch Hybrid." "China" hybrid is a term used, but is not got in t way,—it is used to indicate a low *jât* of plant.

Is it not natural to suppose that, if the Assam deteriorates being crossed by the China, the China would be improved by be crossed by the Assam. This, however, is not the case: no impro *jât* is ever the result. Therefore, it is no hybrid. I have had portunities of tracing the seed from the indigenous trees growing the jungle down to the lowest *jât*. It runs on a downward sc Seed from the indigenous produces a fine plant which we will No. 1. Seed from No. 1 produces a plant slightly inferior, which will call No. 2. No. 2 produces a plant inferior to it again, and so until you get down to a *jât* of the lowest description. Planters do admit that the plant they are growing is not a hybrid, but I th most of them are cognisant of the fact that the plant does deterior and that seed from one *jât* always turns out an inferior *jât* to parent. Having settled which of the different grades of the pl is the one to grow, secure seed not from the *jât* of plant you wa but from the *jât* above it which produced that plant. Of cou there are places which from want of cultivation, unsuitable soil, some other cause, show a *jât* which might be anything.

COMMERCIAL FRUIT-GROWING.

THE series of lectures on horticulture, projected by the Agricul ral Department of Victoria, Australia, was inaugurated on 1 September last, when Mr. C. B. Luffmann, Principal of the Gove ment School of Horticulture, Burnley, lectured on the subject Commercial fruit-growing. There was a large attendance. Luffmann, in the course of an interesting lecture, said that fru growing was not a thing to be picked up in a haphazard way. was a precise art, and there were commercial laws which had to mastered if anyone hoped to rise through his labours in that dir tion. He must begin at the beginning, go steadily, and in prop tion to his resources. He must apply himself to understanding t first principles of his business. He must not experiment. Expe mentation was for those who had made money, or for those w might be termed wealthy amateurs. As to fruit growing, it co be said that failure at this occupation could generally be traced want of capacity, either through lack of knowledge or of indust The climate was favourable to the production of high quality fr provided there was the capacity and industry to help that quali A tree had not merely to be stuck in the ground in order for it grow. It had to be "planted" and cared for systematically. Th as to the quality of fruit, the majority of people did not kn quality. They took bigness for that virtue, whereas it was n They must have precise knowledge of the way to prune trees keep up the supply of wood, to cut back, and so on. Prunin hybridising, &c., were not, as some thought, the outcome of a sub form of genius. Rapid growth in trees was weak growth, and th must also understand whether there was a permanence in the t which would be profitable. In some districts there were permane soils, but in other districts the soil had been cultivated to exha tion, and other causes combined to make the tree arrive very quic at maturity. For that reason these areas would have to be co nually replanted. There was much to attract the young people this colony to the soil, and at present we were doing a very wr thing in having nearly half our population centred in two or th towns, instead of developing the resources of the soil.—*Ind Gardening*.

GROUND "COFFEE."

IT is tantalising to think of what the consumption of Coffee mi be as compared with what it is. Advertising and canvassing is l wanted than honesty. It is adulteration that lessens the dema Coffee. It has a twofold effect: (1) it deprives the product of

reputation, for a decoction that should be fragrant and comforting if made from pure Coffee is not so when made of the adulterated stuff sold under that name; and (2) it lessens the offtake of Coffee by substituting something else under its name. A few examples will suffice to show the variety of adulteration that is still practised. These are taken from the report of Professor Cochran to the Department of Agriculture at Washington on his analyses of a large number of samples of "ground coffee" and "ground-coffee compounds," selected in Eastern Pennsylvania. Here are some of the "compounds" that are sold as *Coffee*:—

"Composed of bran, cracked wheat, and a little caramel; chiefly wheat-bran sweetened and roasted."

"Sample bears about the same relation to coffee as wheat screenings do to wheat."

"Roasted sweetened wheat, 75 per cent.; coffee, 25 per cent."

"Composed of the roasted and rather finely broken grains of wheat and barley."

"Sample is composed chiefly of wheat bran."

"Composed of roasted cereals and husks of cocoa-beans."

"Coffee, about 64 per cent.; pea hulls, 13 per cent.; and chicory, 23 per cent."

"Sample is roasted rye."

"Sample is roasted barley."

"Sample is composed of wheat, chicory, coffee, and peas coarsely ground."

"Composed of peas, about 69 per cent.; grains, 29 per cent.; and chicory, about 2 per cent."

"Sample is composed of bran, cracked wheat, chaff and caramel."

"Sample is composed of wheat, chicory, coffee and peas, all coarsely ground."

"Of all the samples examined, but four were found to be composed of pure coffee, and of these, three were pronounced to be of "very inferior quality."

SIR JOHN LUBBOCK AND INDIAN CURRENCY.

ADDRESSING a meeting of bankers in Dublin on 28th ultimo, Sir John Lubbock discussed the Indian currency question. The difficulties of the Indian Government, he said, were due, not to a fall in exchange, but to a fall in silver. A stable exchange was no doubt desirable, but it was still more desirable to maintain a sound currency and a satisfactory standard. He suggested that the Government should impose a duty of, say, 6*d.* per ounce on silver imports, with 1*d.* seigniorage on the silver coined. An import duty on silver would not only bring in a substantial revenue, but it would increase the demand for Council bills and diminish the difference in value between coined and uncoined silver in India. It was not beyond the range of practical politics that with an import duty and a seigniorage the value of silver in relation to gold would be such as to enable the Government of India to reopen the Mints, and thus secure once more the inestimable benefit of a sound and satisfactory currency.

* * *

Sir John Lubbock's contribution to the Indian currency discussion is well timed, says the *Financial News*, for the sittings of the Committee are to be resumed this week. Sir John is a representative gold standard man, and he is completely out of sympathy with the proposals of the Indian Government. It is impossible to have a gold currency in India, and Sir John Lubbock, like most sensible people, revolts against a standard of one kind and a currency of another. He dismisses the notion of transforming the whole of the existing circulating medium into token currency and creating the fiction of a gold standard; for Sir John Lubbock is not fond of fictions in such serious matters as currency. The worship of a stable exchange as the be-all and end-all of Indian monetary policy annoys him; for it is a means only, and not an end. If stability in exchange is attained at the expense of trade and industry, it becomes an evil instead of an advantage. In vain will the Indian Government, and those who believe in its nostrums, seek a syllable of encouragement from Sir John Lubbock. He speaks of the great responsibility of watching the hocus pocus standard now in operation, and says it is the sort of responsibility no Government should desire to undertake. He points to the two concomitants of a restrictive currency policy—the encouragement of illicit coinage and the tendency to "disestablish the Queen's head" by the substitution of bullion for coin in certain operations. Sir John Lubbock can see no necessity for melting down rupees or raising a loan so as to hoard the proceeds in gold. For every step taken or proposed by the Indian Government with reference to the currency Sir John entertains the most thorough contempt, because all of them have smacked of artifice.

COCOA DISEASE.

IN our last issue we gave certain brief rules regarding the treatment of Cocoa disease, which are to be circulated in Ceylon, in Cinhalese and Tamil, for the information of Native cultivators. The following prefatory remarks, drawn up by Mr. Carruthers, are to be printed with the rules:—

The cocoa disease is caused by the presence in the tree of a fungus. A fungus is an extremely small plant, and in this, as in many other cases, it lives in another plant, and gets all its nourishment from the sap of the other plant. The fungus consists of two parts: 1st, the *mycelium*, or roots, which are small threads, too small to be seen with the naked eye, and which run through the tissues of the cocoa tree, and 2nd, the *spores* or seeds which spring from the mycelium; the spores are very small indeed; several millions, one layer thick, would only cover a ten-cent piece. If these spores alight on a cocoa stem branch or pod, in damp atmosphere, they will grow and produce another canker spot. The canker in the bark can be seen, as a rule by a darker patch, and by drops of red-coloured fluid exuding, and when the dark outer skin is scraped off, the place will be seen to be quite brown or red-coloured and moist and slimy. In the pod it makes the part where it is brown or blackish-brown. The spores are in white or pink masses on the surface of stem and branches, and of all sizes, from what can hardly be seen to three or four times the size of a grain of rice. If the dark patches are allowed to remain in the tree, they will spread and kill it, and form many millions of spores which may attack other trees. The cutting out—if the disease has not gone too far—does not materially injure the tree or its bearing qualities; and it is no use to keep diseased pods on the tree, as directly they have a spot of disease, the seeds no longer in crease in size or ripen, but begin to deteriorate. When the trees are diseased suckers should be allowed to grow.

RULES FOR CURING DISEASE

In the Bark.—Cut out all discoloured tissue and two inches all round it.

In the Pods.—Take off all pods with any trace of disease. (The small pods of an inch or so in length are generally not diseased, but dry up from want of nourishment.)

Burn all parts cut out and all diseased Pod Husks.—In cases where burning is quite impossible, bury the bark and pods deep. Lime put on them is advantageous. (Signed) J. B. Carruthers, F.L.S., Cryptogamist to Ceylon Planters' Association, November 18th, 1898.

TEA IN GERMANY AND RUSSIA.

IN the opinion of our Consular representatives there is no doubt that the taste for tea is fast increasing in Germany. It is, however, at present confined to the wealthier classes. From the fact that tea as at present sold retail, to be at all palatable, is extremely high in price—these teas being mostly caravan* teas imported from Russia, and ranging from 6 to 10 marks (5*s.* 11*d.* to 9*s.* 10½*d.*) per lb.—it is suggested that there is an opportunity for the introduction of Indian and Ceylon teas to the German market. In the first place because they are cheaper and better than that at present obtainable, and secondly, because as the taste is, so to speak, in its infancy, the liking for the more highly-flavoured growth of India may be easily introduced. The cause of the retail price being so high is said to be the very limited demand and the length of time that the tea is kept in stock before being sold, but if a good tea at a reasonable price could be put on the market, with a satisfactory agent to push it, the business might soon find considerable extension. The duty on teas is charged

[* The so-called "caravan" teas are probably mostly quite ordinary leaf, passed off as genuine overland.—ED., *P.O.*]

at 50 pf. (6*d.*) per lb. as per chest, allowance being made for the wood and lead wrapper. Thus a good tea could be introduced at a retail price of 3 marks (2*s.* 11½*d.*) per lb., or even less, with a considerable profit to the merchant. The Consul at Stettin says the tea at present sold there at 3 marks (2*s.* 11½*d.*) per lb. is not fit to drink, and "it is doubtful whether it is tea at all." In Russia Odessa is stated to have become the centre of the tea trade. Shipments used to be made *viâ* London, but latterly tea destined for Moscow and other towns has been largely stored at Odessa. China teas are imported in ships of the Volunteer Fleet, which has now practically the monopoly of the tea carrying trade from China. The total imports of tea into Russia last year, including those entering the country over the Asiatic frontier, were estimated at about 40,330 tons. The trade in Ceylon tea in Russia, gauged by the quantities imported, has increased very much of late, both as regards direct shipments, chiefly to Odessa, and those *viâ* London. The importance of this growing market and the necessity of understanding its conditions are now recognised in Ceylon, and a member of the Legislative Council of that island was appointed at the end of last year as a commissioner to visit Russia, inquire into the circumstances of its tea trade, and report. The very high import duty charged on all tea entering Russia is felt to be the chief obstacle which stands in the way of increased consumption. The shipments of Ceylon tea to Russia (almost entirely to Odessa) were 439,350lb. in 1897, while from London 1,578,390lb. were imported. But these figures do not represent the total importation of Ceylon tea into Russia, as much that is shipped to Germany is really destined for transportation to that country. —*Grocer.*

THE NEW YORK TEA MARKET.

MESSRS. JAMES AND JOHN R. MONTGOMERY & Co. report the following statistics of tea for United States and Canada. The total includes all sorts :—

	Pounds.
Total afloat to October 1st, 1898	7,110,921
Receipts to October 1st, 1898	30,346,401
Total shipment advised by mail	37,457,322
Leaving to be shipped	46,292,678
Estimated supply, seasons 1898 and 1899 ...	83,750,000
Supply, seasons 1897 and 1898	87,711,780
Afloat, October 1st, 1897	11,334,026
Total shipments advised by mail to Oct. 1st, 1897 ...	51,981,621

At the auction sale by the Montgomery Auction Company on October 5th, 4,029 packages were sold. The new Greens brought low prices, but good figures as compared with recent prices obtained for old crop. The foregoing is from the *American Grocer* of the 12th October—that friend of British-grown teas—and details of the auction follow; but they contain no reference to Indians or Ceylons. Then comes the subjoined table, with its instructive concluding line, which shows how the market in the States has "gone to pot" :—

IMPORTS—TEA.

Year ending June 30—	Net Imports Pounds.	Value Dollars.	Av. Import Price, ¶ lb. —cents.	Per capita Population Pounds.
1880	69,894,769	18,983,368	27·4	1·39
1881	79,130,849	20,225,418	25·7	1·54

1898	67,696,339	9,608,252	14·2	0·91

TEA CONSUMPTION IN GERMANY.

MR. OTTO WESTPHAL, a partner in Messrs. G. W. A. West Sohn & Co., of Hamburg, writes to the *I. P. G.* :—

In the issue of your esteemed paper of September 24th, H M.'s Consul in Stettin reports on tea consumption in Germany very incomplete information.

In Stettin there is no real wholesale tea trade, and less tea is sumed in the environs than in many other parts of Germany. British Consul, even admitting (which I do not) that his statem are correct, as far as Stettin is concerned, errs if he applies remarks to Germany in general.

As to caravan tea, many retailers flattering an old prejudice of public sell their tea under this flag. The import of tea from Ru into Germany is quite insignificant, and probably there is no caravan tea among it; fine teas are no longer sent by caravan. markets which supply Germany are Hamburg and Bremen.

It is a mistake to say that the retail price for tea in Germ ranges from 6*s.* to 10*s.* per lb; even 6*s.* a pound is very seldom out for a pound of tea. In Hamburg a good tea is sold at 1/5½*d.*, in every place worth mentioning a very fair quality can be bough 2*s.* a pound.

Now as to Indian tea, the German tea trade in general, and firm specially, take a great interest in the introduction of Indian and I am glad to say with increasing success. Blending is com more and more in use in Germany, and for such purposes Ind especially very flavory Darjeelings, are much liked. The majo prefer them to Ceylons.

In my opinion and experience it would be a fatal mistake to fol the British Consul's advice to send a competent man to Stettin push Indian tea. In the very same way as in England and elsewh Indian tea must make its progress on the Continent by being in duced in blends. The English public always liked a strong tea; they began by mixed Indian to China produce. The German t prefers a flavory, mild beverage; our countrymen and countrywo therefore, are less inclined to adapt their taste to Indian tea. Continental consumer will not allow the latter to be forced u him; he must be flattered into the use of Indian-grown tea. T requires time, and the representative whose presence in Ste desires will not be able to do much within the short time which be at his disposal.

Advertising tea is a bad job in our country, where the consump is still small (in that the British Consul is right). A Koenigsberg in former years and a prominent English dealer some time ago tur to advertising in Germany, but both gave it up again disguste the poor result.

If the Indian tea-growers wish to foster the German market, t need only do what will attract all the Continental and Colo buyers: "Stock the Calcutta auctions well with a good variety faultless teas, and if possible bring down the carriage, selling shipping charges in Calcutta."

Besides this, the visit of an agent of the Indian Tea Associat might, of course, do some good, and I shall be very pleased to come the gentleman in Hamburg and to co-operate with him.

ECONOMIC BOTANY.

IT was Victor Hugo who placed the beautiful before the use But this is a utilitarian age, and it must have struck those who t note of the "signs of the times" that the trend of modern thou is in the direction of combining the *utile* with the *dulce.* Thi specially noticeable in botany and horticulture. When Cato r Rome, he imposed upon each Roman citizen the duty of cultiva flowers in his enclosure, so that elegance and culture migh imparted to the manners of the people. It was Pliny, however, was the first to make a catalogue of the plants of the Ro Empire of his day: at least, we have no other record before this far as we have been able to glean. Charlemagne, though a g soldier, had an eye to the *utile,* and in his Capitularies gave a lis the vegetables to be grown in his garden. We are led to th remarks by the perusal of an interesting address to garde delivered by Alphonse de Lamartine, in the course of whic pointed out that the art of gardening—first sketched out by Romans, universalised and brought to a prodigious state of pe tion in China, enlarged in England to the proportions of an ari cratic luxury, depreciated and strained in Holland to the poin

adoration of the tulip, raised in Italy to the dignity of a splendid art in association with statuary, sculpture, and architecture, utilised in France by its alliance with high agriculture, of which it is the enlightener—at last reaches in several parts of Europe the condition of an industry, employing millions of hands, and importing and exporting millions of fruits and flowers. Thus gardening, which was hitherto a recreation, a domestic luxury, a decoration of the earth, is becoming a new and magnificent subject of commerce at a time when work fails man rather than man work; at a time when the notion of an industry is the inventien of a source of wealth, is the invention of an occupation, of a livelihood for thousands of workmen.

Upon the litoral of the Mediterranean there is a very large coasting trade done in flowers. Tuscany and the State of Genoa cultivate and export to the value of several millions the produce of their ocwerbeds. But one art has begotten another. After the art of their cultivation has come the art of harvesting, assorting flowers, flours, shades, scents. This art has made much progress at Genoa, for instance, to such an extent that roses, carnations, dahlias, tulips, oanunculi, have been studied, combined, interwoven, plaited, that bouquets intended for the table at festivities, often more than a yard in circumference, resemble Smyrna carpets, vegetable fabrics, perfumed velvets, mosaics of vegetation. Veritable weavers weave these perfumed tissues. The bouquet-makers there, as at Athens, form a profession by themselves. The bouquets admired at the *fêtes* of Toulon, Marseilles, even Paris, have often been woven at Florence or Genoa. Thus luxurious gardening becomes more and more an industry. Go on perfecting it, said the lecturer, and it will become a new art, a painting, of which the palette will be a garden.

Our Botanic Gardens, which were once merely the repositories of rare plants brought together from all parts of the globe, are now being utilised, to a certain extent, for the study of economic botany; indeed, this department will have to be greatly developed in the near future if these gardens are to keep abreast of the times. The mere fact of having a unique collection of plants, and their conservation, will not satisfy the public. A beginning has been made in this direction at Kew, Ceylon and Calcutta, and this section will doubtless be largely developed in all the Government botanical gardens scattered throughout India. This is a country of vast economic resources; her vegetable products are perhaps more numerous and varied than that of any other country in the world. We know practically nothing yet of her vast range of vegetable fibres, medicinal plants, colour-yielding plants, *et hoc genus omne*. Our investigations will have to be directed into channels left hitherto unexplored. We are continually receiving valuable economic plants from other parts of the world for cultivation or experimental purposes; whereas, had we known the economic value of the plants of the same genus we have in the country, a lucrative trade might have been established long ere this. We could give several examples of this, but two will suffice, namely, the Soy Bean and the Florida Velvet Bean. We have the counterparts of these out here, but of whose valuable properties we have known nothing. Again, we are experimenting with Para and Ceara rubber trees when we have the finest of all rubber-yielding trees—the *Ficus elastica*, growing as a great forest tree in nearly all parts of the country. The *Cryptostegia grandiflora* is another rubber-yielding plant, growing wild everywhere, to which we are only now directing attention. We might go on citing examples, but we think we have said enough to show that what we want in this country is the study of economic botany, a subject which should be made compulsory in every school and college in India, so that in a few years we should have a large number of young men specially trained to investigate and discover new sources of wealth in the vegetable kingdom. Every botanic garden should have a number of such students attached thereto for the purpose of receiving a practical training in economic botany. We should then be able to produce men who understanding the country, the flora and the people, would soon develop the vast natural resources of India. —*Indian Gardening.*

TEA MAKING FOR QUALITY.

[By A. Cooke.]

We take the following excerpts from an article by Mr. A. Cooke, Manager of the Chota Nagpur Tea Company in the *Planter:*

Since I came out (end of 1874) I would roughly divide the "paying leaf into periods as follows:

1874	to 1880	5	leaves on a shoot, average.	
1881	„ 1890	4	„	„
1891	„ 1896	3	„	„
1897	„ ——	2	„	„

I do not say that the average leaf of 1874 to 1880 was "five leaves,' but during that period this extremely coarse plucking would have paid expenses.

As the quantity of tea increased, the quality was improved by finer plucking. In spite of the finer plucking and improved appliances for manufacture, we have noted an unceasing discontent on the part of the brokers, and we must interpret this to mean that the quality as supplied by the planter has not quite kept pace with the quality demanded by the consumer. . . . The bulk of British tea has to become of finer quality. And the *ultimate* price has to come down to six pence. . . I myself have made a speciality of my Orange Pekoe, which has risen about three annas per pound during the last four years. I have taken care to protect it in the sorting, but the chief reason of the improvement has been finer plucking. I imagine that this tea has gradually become known to a greater number of buyers year by year and so raised its price because of the competition between them. . . The problem now is "how much fine leaf" can be got off a garden, and not "how much weight of leaf." It certainly must be a greater strain on a bush to take the utmost weight of fine leaf, because this can only be attained by a greater number of shocks (pluckings); but this may possibly be counterbalanced by giving more rest, or by reducing the pruning, or by liberal manuring. I believe that the roots do not suffer, if the bush is allowed a fair number of leaves to send sap back for the formation of bark and wood, *until they exhaust the food in the soil.* Given sufficient growth, they will continue to supply fresh leaf, although this fresh growth is constantly plucked off. For the purpose of feeding the bark and wood, I think it necessary to leave unplucked all the shoots which go *bhanji.* And following the same line of argument it is probably politic to let the bush *have its flowers and seeds* if it produces any. The production of flowers is a sign that the bush wants a rest from leaf-giving;—let it have its rest. Plucking-off the flowers would stimulate the bush. Take flowering and going *bhanji* as a sign that the bush wants a rest or wants richer soil. Give either the rest or improve the soil. . .

With a view to getting the most fine leaf, year by year, without a break, I think the most important point is to establish a system of cutting out old branches each year, so that the bushes need *never* be cut down. I have entirely stopped cutting down on this garden, and my best plots are those which have not been cut down for ten years at least. After each pruning I send round a separate gang to cut off useless branches.

Obviously the greatest hindrance to fine plucking is the amount of labour required. Last year I plucked off ten shoots of three leaves and a bud. I weighed these with the seeds of the liquorice plant (which are of every uniform weight). The 10 shoots weighed 95 seeds. I separated the 3rd leaves and 10 of them weighed 47 seeds. The bud and two leaves weighed 45 seeds. This shows that a cooly, plucking three leaves and a bud, would get in more than double weight by the same amount of work as she would if she plucked only two leaves and the bud. But it is quite certain that at the present time tea of three leaves would not pay as well as tea of two leaves.

Three-leaf tea. 1,000 maunds, sold at Rs.20 ...		Rs.20,000
Less cost of plucking, manufacture, boxes, freight, &c., Rs.12	„	12,000
Balance	„	8,000
Two-leaf tea, 500 maunds, sold at Rs.30 ...	„	15,000
Less cost as above at Rs.12	„	6,000
Balance	„	9,000
Two-leaf tea of finer quality, 400 maunds, sold at Rs.40	„	16,000
Less cost of as above at Rs.12	„	4,800
Balance	„	11,200

In my own case I have improved the quality of my leaf from year to year, and have managed to keep the average price within two pice. I have improved my bushes, but instead of increasing the yield I have kept it on one level and plucked finer.

I recommend this policy strongly to the bulk of British planters (*i.e.*, Indian and Ceylon). And I have endeavoured to show how it may be possible to obtain more fine leaf from the same bushes and with the same labour force. I do not mean that the bushes will give the same yield of fine as of coarse leaf. What I mean is this:—

1. By "close plucking" after, say, nine inches has been grown, and plucking round in five days, the same bushes and same labour force will yield more money for the tea made than by—

2. Leaving one or more leaves on each shoot all the year round, and plucking round in ten days. It is beyond my experience as yet whether any bushes (even on the best soil) will stand close plucking and annual thorough pruning. I intend to prune one plot for several years in succession and see whether it improves or deteriorates. If it shows an increased yield for a time, and then begins to fall off, I will try to find out whether the cost of sufficient manure to bring the yield level again will leave a margin of profit. By "thorough" pruning, I mean *cutting of all new wood thinner than a pencil.* Gardens with good soil might be able to stand alternate thorough and light pruning, *i.e.*, taking off only three or four inches from the top. But I imagine that the best results, all around, that is to say, getting the greatest quantity of the best leaf, and allowing the bushes to keep at one level of health, can be attained by pruning thoroughly and not pruning at all each alternate year, . . .

There is the old saying that the man who makes two blades of grass grow in place of one is a benefactor, but in our case we want to show how one maund of tea can bring in as much money as two maunds, so that we may relieve the strain on our markets. At present I think that I have shown that it is good poliey to improve the leaf if you are getting low prices: of course, if you are getting good prices, it would be folly to make any change.

TEA COMPANIES.

The Imperial Tea Company, Limited.—The yield of this Company to 31st ult. is 2,244,400lb. as against 1,832,080lb. to same date last year, showing an increase of 412,320lb.

The British Assam Tea Company, Limited.—The yield of this Company to 31st ult. is 439,840lb. as against 354,000lb. to same date last year, showing an increase of 85,840lb.

Korale Tea Estates, Limited.—The net amount at credit of profit and loss account, after providing for general expenses, is £1,623 19*s.* 2*d.*, to which should be added the balance brought forward from June 30, 1897, £31 8*s.* 8*d.* It is proposed to pay a dividend of 3 per cent., which will absorb £1,436 11*s.*, and to carry forward a balance of £218 16*s.* 10*d.* The year ending June 30 has been generally the worst, so far, experienced in the history of Ceylon tea; in addition to the upward tendency of the rupee, rice has again been dear and freight higher, owing to the port of Calcutta being closed from fear of spreading the plague. In addition to these causes, the island has suffered from a most unusual drought, and the Ouvah side of the country, where Wewesse is situated, has not for many years been known to have so small a rainfall. This has checked the flush of the tea and caused a smaller yield than was expected, not only there, but at Glenloch and Karagastalawa. A new factory with improved machinery has been erected on Wewesse, and this will enable the tea to be better made than hitherto, resulting, the directors hope, in a better price in the market. During the past year 126 acres have been planted with tea on the Company's estates. This year the directors did not deem it prudent to declare an interim dividend, but, owing to the improvement shown in the latter part of the year, are glad to be now able to recommend one of 3 per cent. for the past year on the preference shares, which, judging by the experience of many other Companies during the same period, may be considered a satisfactory result.

Central Tea Company of Ceylon, Limited.—The net amount at credit of profit and loss account, including the balance brought forward at June 30, 1897, and after providing for general expenses, directors' fees, income-tax, &c., is £2,729 2*s.* 2*d.* Dividends on the 6 per cent. preference shares were paid for 1897-98 (less income-tax) amounting to £1,133 0*s.* 8*d.* It is proposed to pay a dividend of 6 per cent. (less income-tax) on the ordinary shares, which will absorb £1,073, and to carry forward to next year a balance of £523 1*s.* 6*d.*

The gross average price realised for the tea was 7·75*d.* per lb. as against 7·52*d.* per lb. last season, and the rate of exchange 1*s.* 4*d.* as against 1*s.* 31-32*d.* The total crop amounted to 351,646lb., or 409lb. per acre of tea in bearing.

The Goomera (Ceylon) Tea Estates Company, Limited.—T accounts, after paying debenture interest, show a loss of £131 1 which, when deducted from the credit balance brought forward fr last year, leaves sufficient to pay the preference dividend, and this accordingly been satisfied. The result of the year's working has b most disappointing. A drought of almost unprecedented severi covering the best plucking months of the year, reduced the quant of tea manufactured in Goomera, so that it turned out 58,000lb. bel last year's crop figures. There was also a shortage on Hunug from the same cause. This large falling-off caused a great incre in the cost per pound of the actual crop harvested, so that the pri realised left a very small margin of profit. Markets for the C pany's class of tea were poor throughout the year, but had the e mated crops been obtained, a dividend would have been earned for ordinary shareholders. The estates of the Company are reported be in a thoroughly good order. The directors believe that the p results of the last year's working do not affect the producing po of the Company's property.—*H. & C. Mail.*

Lanka Plantation Company, Limited.—The coffee crop shipped London was 247 cwt. against 572 cwt. last year, and realised £1,(11s 8d net. The acreage under coffee alone is nominally 164 ac The total crop of cocoa gathered on Yattawatte amounted to 1, cwt. against 1,272 cwt. last year, and realised £4,806 14s 10d. D ing the season 34 acres were planted with cocoa, and 18 acres available land adjoining the estate have been purchased, makin total of 268 acres new land. The cost of the land and the new pla ing are charged to capital account. On the same estate 2,125 cardamoms were gathered realizing £269 16s 6d. The tea recei from the company's estates amounted to 731,593 lb. and has been s at an average of 7·45d per lb. net realizing £22,840 18s 1d. Last y the company received 701,112 lb., which was sold at an averag 7·53d. per lb. net, and realized £22,002 8s 4d. The cost of product has been increased by a further rise in the sterling value of rupee. The average rate at which drafts were negotiated on acco of the season's crops was 1s 4-3/32 d. per rupee, against 1s 3d year: this further rise representing a loss of about 1 per cent. on ordinary share capital of the company.

The net profits for the past year amounted to £6,149 13s 8d, which must be added the sum of £495 8s 2d to the balance brou forward from the year 1896-7, making together £6,645 0s 11d. H ing already paid a half-year's interim dividend on the six per c preference shares to the 31st December, 1897, amounting, less p perty tax, to £426 6s 0d, the Directors recommend payment of dividend on these shares to the 30th June last, requiring, less p perty tax, a similar amount, and having deducted £1,398 2s 0*d*, be one-tenth of the sums charged to suspense account during the years ending 30th June, 1897, they further recommend a d dend of 5 per share, being 2½ per cent. free of income tax on ordinary shares amounting to £3,750, carrying forward a balanc £644 6s 11d to the next account.

Central Tea Company of Ceylon, Limited.—The Directors have pleasure to submit the general balance sheet and profit and l account for the year ending 30th June, 1898, duly audited.

The net amount at credit of profit and loss account, including balance brought forward at 30th June, 1897, and after providing general expenses, Directors' fees, income tax, &c., is £2,729- Dividends on the 6 per cent. preference shares were paid for 189 (less income tax) amounting to £1,133-0-8. It is proposed to pa dividend of 6 per cent. (less income tax) on the ordinary sha which will absorb £1,073, and to carry forward to next yea balance of £523-1-6. The gross average price realized for the was 7·75d per lb., as against 17·52d per lb. last season, and rate of exchange 1s 4d as against 1s 3 1-32d. The total crop amoun to 351,646 lb., or 409 lb. per acre of tea in bearing. At an extrao nary general meeting, held in May, 1897, it was resolved that share captial of £45,000, divided into 1,500 6 per cent. preference 3,000 ordinary shares, be altered to 2,250 6 per cent. preference 2,250 ordinary shares. The necessary agreement drawn by the C pany's solicitors was signed by all shareholders, and duly registe with the Registrar of Joint Stock Companies on 14th July, 1 157 ordinary shares were cancelled, and 157 preference shares iss in lieu thereof. The 593 unissued preference shares were offe to the public in December, 1897, at a premium of £2 per sh These shares were duly taken up, and the premium arising therefr viz., £1,186, it is now proposed to write off from the cap accounts of the estates.

COFFEE PLANTING IN BRAZIL.

Dr. F. W. Dafert, Director of the Institute of Agriculture in the State of Sao Paulo, Campinas, Brazil, is the author of a pamlphet on coffee planting in Brazil, in which consideration is given to the present position of the industry. It is published by J. H. de Bussy, Amsterdam, Holland, and translated for the *American Grocer* and a digest made by J. F. Geisler, Ph. C., as follows:—

The total amount of land under cultivation for coffee in 1895-96 was estimated at 2,245,557 hectares, and the world's product at 836,000 tons, of which Brazil produced 460,000 tons upon a cultivated area of 1,000,000 hectares. Although Brazil embraces about 8·3 million square kilometres (an area equivalent to that of Europe), and only about one-tenth of this is excluded from the possibility of coffee culture, yet economical reasons exclude nine-tenths of the theoretically available area. Of the latter, much is of poor quality, but can be made very productive through artificial fertilisation which would bring into active factors the *campos* (grass lands) and *terra exhausta* (exhausted soils).

The lands originally selected for coffee plantations were almost exclusively such whose *flora* consisted of primitive forests or wood lands. Rarely were the *campos* ventured upon. While nature of soil, amount of moisture, and climate are the prime factors in the selection for plantations, the lands should not be exposed to frosts or the cold south winds. The soil should not be wet, and must be porous and deep, to prevent injury to the tap root.

Geologically, the best coffee lands are those of recent volcanic origin, as evidenced by the diorite, melaphyre, and porphyr rocks. To this group belongs the *terra roxa*, a dark red soil. The *terra vermelha* a lighter red soil, inferior to the former, originated from the paleozoic and triassic ages. One of the best Sao Paulo soils, known as *massapepreta*, is a rich humus soil. The best soils are rich in phosphoric acid and potash, containing usually 18 to 35 per cent. of the former and 10 to 26 per cent. of the latter. The fertility of the soil is usually indicated by the number, strength, and character of the trees.

The varieties of climate in Brazil are so great within the cultivated zone that Rio coffee is usually marketed a month sooner than Santos coffee, while the crops of Brazanca and Atibaia do not mature before October.

Of the varieties of coffee, *cafe nacional* is the most widely cultivated. It is less productive than the *cafe Bourbon*. The latter exhausts the soil very quickly, and is, therefore, not very popular with planters. *Maragogipe* is a large berry of limited production and high market value. *Botocatu*, a local yellow variety, known in India as "Golden Drop" coffee, is not much culitvated. The variety stands between *cafe nacional* and *cafe Bourbon* in productiveness. A very scarce variety of scientific interest is the *cafe hybrico*, with four to six berries instead of the two berries common to the other varieties.

At present the varieties cultivated are divided approximately at 75 per cent. Arabian, 20 per cent. Bourbon, and the rest between *cafe Botocatu* and *Maragogipe*.

The abolition of slavery in 1888 raised the cost of production of coffee and, in a measure, also the method of cultivation. By the old method, as soon as a land showed a tendency toward short crops, the planter with his slaves moved to the interior, where he had acquired new lands. The primitive forest was cut down and the land planted with young trees from the old plantation, or seedling was resorted to. It required three and-a-half to four years before the new plantation became productive. By the new method a well-manured seed-bed is prepared and the young plants carefully nursed and transplanted two or three times, and gradually accustomed to the sun. The small trees are then transplanted in baskets in rows carefully spaced so as to permit the use of machines for hoeing. The careful nursing of the plants yields in one and-a-half years what the old method scarcely produced in four years. The land is kept free from weed, and for this purpose is machine-hoed at least five times.

To restore the amount of mineral matter annually removed by the crops the added fertiliser should contain about eight grammes phosphoric acid, thirty-five grammes potash, and sixteen grammes nitrogen per tree. Stable manure must also be applied to the soil to get the best results.

For practical purposes the farm or plantation should be divided into two sections—one for coffee cultivation proper and the other for food and fodder. The ratio for practical purposes should be, at least, for 10,000 trees fifteen hectares fodder land and five hectares animal land. The manure from the latter plays an important part in the successful working of the plantation.

In gathering the crops the ground under the tree is carefully cleaned and the berries allowed to fall on the same. Double picking, to separate the ripe and unripe berries, is frequently resorted to, but is not a universal practice. The picked berries were formerly dried in the sun on mats, the operation taking several weeks. The dried berries were then shelled, cleaned, sorted, and marketed. The average yield per tree was 300 to 900 grammes, the hectare containing 900 to 1,100 trees. The maximum yield ranged between the tenth to fourteenth years, and varied from 270 to 900 kilos per hectare. In the modern plantation the trees are planted in line four to six metres apart, and the soil fertilised with a mixture of stable manure and chemical fertilisers.

The preparation for the market of the picked berries is done by both the wet and dry process. Usually the picked berries are put through a decorticator, in which the ripe berries are crushed, while the unripe hard berries pass through unchanged. The latter are dried separately. Since the ripe berries float and the unripe berries are heavier, this method is frequently resorted to for their separation. The berries are spread out in layers for drying, the decorticated berry requiring about five days (if dried in shell, eight days), while the green berry requires twenty to thirty days, according to the weather.

The drying process is now much improved by sorting the berries according to their size. The berries are first dried in the sun for a few days, by which operation they lose about 50 per cent. of the moisture. They are then transferred to drying-chambers, and the drying rapidly terminated; so that the whole operation is finished within five days, whereas the old method required twenty to thirty days. Moreover, the degree of moisture of the berry is more accurately judged during the artificial drying. Thus the blue berries contain more moisture than the green, and the latter more than the yellow.

The modern method of applying fertilisers tends to an increased production of coffee. Thus the products from fifty trees raised in the trial gardens averaged per tree as follows:

	Planted					
	1892.	1893.	1894.	1895.	1896.	1897.
	Gram.	Gram.	Gram.	Gram.	Gram.	Gram.
Unfertilised	25	35	200	90	605	560
Fertilised	40	120	780	485	700	900

For well-fertilised trees twenty years old the product should average 2·5 kilos per tree. Relative to the future of coffee culture in Brazil, there is nothing in the natural conditions to prevent either the continuation or expansion of raising coffee in Brazil. The principal difficulties are in the management.

The present position of the planter is very precarious, and most of them may be compelled to sell or surrender their properties to the mortgagees. In that event the new possessors could work the plantations to advantage at the present prices. A great many Italians have been imported and have displaced slave labour on the plantations. There is no likelihood of these Italians emigrating, as no other land offers any better advantages for obtaining subsistence and which condition invites further immigration.

PRODUCE AND PLANTING.

All is Lost. As the tea industry is at present under a cloud, there is no lack of good-natured friends to sigh over the position and say: "We told you so." But for a really depressing, never hope-again way of regarding things, the following from the *Pall Mall Gazette* deserves special mention. The writer of this dirge says: "The public should be in the mood at present to consider the dross in their treasuries, and we commend Indian tea shares to their unfriendly attention, should they be burdened with this particular class of security. There can be but little doubt that the trade is entering upon a crisis, which will account for the anxiety of certain retailers to convert their undertakings into limited liability companies. The weak spot is the planter. The enormous increase in output and the increase in the area under tea are having results usual when production is outstripping consumption. Some of the

pessimists profess to see in improved Chinese methods an influence that will act adversely to Indian growers. It is sufficient for the present in this respect to note that the Indian planter always has the initial advantages of cheaper labour and the actual hold on the markets. The real difficulty is over-production. Private advices from planters of experience in Assam assures us that the falling off in prices has led to resolutions to considerably increase the output, and it does not require an economist to show that where quantity and not quality becomes the controlling influence the outlook is gloomy enough. That Ceylon will feel the pinch more than Assam is probable. In fact, at the present time we should scarcely desire to see our dearest enemy a holder of the average Ceylon tea share. But the crisis is rapidly approaching in Assam. There being no controlling influence in the matter of the output it is a case of every man for himself. The weak companies and the small planter must inevitably go to the wall during the next few years, and meanwhile there are low prices and seriously curtailed profits to be faced by the sounder concerns. It is thus time that the investor in Indian tea shares should seriously consider his position, and although the storm may not loom up immediately, it cannot be deferred for any very long period." There is not too much "crisis" about this, but just enough. A few figures may be useful, therefore, in order to show that the position is not quite hopeless. The imports of Indian tea for the period June to October this year were 62 million lb. against 61½ in 1897, while the deliveries were this year 55¼ million lb. against 48½ in 1897, and the stock is less now than it was this time last year. These figures are much more to the point than the *Pall Mall Gazette* jeremiad.

THE SAME OPINION STILL.

In reply to the *Pall Mall Gazette*, Messrs. Gow, Wilson and Stanton write, pointing out "that for many years past the production of Indian and Ceylon teas had been outstripping consumption, but since January last this has not been the case, as in Markets outside the United Kingdom, particularly in America, Russia, the Continent of Europe, and also largely in Australia and New Zealand, a very important demand has sprung up for British-grown teas. Owing to the recent increase in this outside demand, the danger of over-production, which has been facing the British-grown tea industry, appears to have already passed. In support of this we now place before you a few rather important figures. For the first nine months of this year the use of Ceylon tea in markets outside the United Kingdom has increased 7 million pounds, the figures being 28 million pounds, as against 21 million pounds for the same nine months of last year. During that period production of Ceylon tea showed an increase of about 2 million pounds, but the net result is that 5 million pounds of Ceylon tea were diverted from the home market. The use of Indian tea in foreign markets is also showing a satisfactory development. We can, however, look to the home market to take our extra supplies from that country. We find that for the first four months of the season, namely, June to September, there has been an increase of five million pounds in the deliveries of Indian tea, a remarkable expansion, while it is estimated that the total production from India will only exceed that of the previous year by some two or three million pounds." The editor of the *Pall Mall Gazette* prints the letter merely adding, "but we see no reason whatever, from the information at our disposal, to alter our view as to the prospects for tea shares during the next few years." This is a long-range prophecy, even allowing that the editor of the *Pall Mall Gazette* is in possession of information quite out of the reach of ordinary mortals.

LAST WEEK'S TEA SALES.

Public sales of Indian tea continue on a liberal scale, but, owing to the steadily increasing demand, no change of importance in values has been established, says the *Produce Markets Review*, referring to last week's sales. The only weakness is in the poor liquoring medium kinds, and even in these the decline in no case exceeded ¼*d.* Most descriptions have fallen to a point that will doubtless further stimulate consumption, and as Ceylon teas are still very firm, it is probable that all desirable kinds of Indian teas have reached a safe level. This view would seem to have been adopted by the trade, as buying during the past few weeks has been more general and on a decidedly larger scale. Values appear likely to be steady at present, and although the supply will be larger for some time to come, the improved demand will in all probability continue, more particularly for the good medium sorts, owing to the excellent value offering. In consequence of the reduced estimate of the crop, and of larger quantities being sent direct from Calcutta to other markets—the increase amounting to upwards of 3,000,000lb.—it is by no means certain that the available supply for this market will reach the rev estimate. The tone of the market for Ceylon tea continues good a brisk demand, the tendency being firmer for most kinds unde per lb. Common to good medium descriptions were in strong req and prices in many instances showed a distinct improvement, altho some lots, with really pungent flavour, realised fully ½*d.* per lb. a former quotations. For the finest grades, however, competition not so keen, and prices occasionally ruled in favour of buyers. exports from Colombo for the nine months from January 1s September 30th show a decrease of 3,000,000lb. against the s period last year, the actual figures being 74,500,000lb. as comp with 77,500,000lb. in 1897.

COCOA AND ITS MANUFACTURE.

Although the consumption of tea is far al of cocoa, the proportion being 10lb. of tea to of cocoa, the public taste for the latter is incr ing, and the *Grocer*, in commenting on this, calls attention to the that foreign cocoa manufacturers are seriously threatening position of English manufacturers in their own markets. It g the following table, which shows the quantities of the arti retained for home consumption in the United Kingdom in the y specified, and the increase or decrease per cent. in each year comp with the year preceding:—

Articles.	1888.	1895.	1896.	1897.
	lb.	lb.	lb.	lb.
Cocoa	19,909,569	27,155,360	28,046,711	36,201,1
	p.c.	p.c.	p.c.	p.c.
Increase ...	13·3	8·8	3·3	29·1
	cwt.	cwt.	cwt.	cwt.
Chicory and coffee...	373,173	331,286	328,990	325,699
	p.c.	p.c.	p.c.	p.c.
Increase ...	1·3	1·7	...	...
Decrease ...	...	...	0·6	1·0
	lb.	lb.	lb.	lb.
Tea	185,416,238	221,731,490	227,722,561	231,328,1
	p.c.	p.c.	p.c.	p.c.
Increase ...	1·0	3·4	2·7	1·5

Thus, says our contemporary, it appears that, although the amo of tea consumed is enormously disproportionate to that of cocoa,

MANURES.

Fish Guano. Steamed Bone Meal. Poonac:—Castor, Mowra, Hoongay. **Saltpetre, Crude and Refined** (Nitrate of Potash.) **Nitrate of Soda. Sulphate of Ammonia. Sulphate of Potash. Muriate of Potash. Superphosphates. Phosphate Powder. Kainits Salts.**

Mixtures can be made in any proportion without extra charge. **Packing** can be done to suit transport by bullocks, etc.

Prices will be furnished on application for delivery either at our Karaparumba Works, Calicut, the Calicut Railway Station, Palghat, Mettapollium, Salem, or at our godowns in Cochin, Tellicherry, Mangalore and other places.

Quotations will be obtained and orders booked for any Manures not kept in stock. F.r.m.

4

yearly amount of the latter has, at any rate, nearly doubled in the ten years. If the present rate of increased consumption continues, it is estimated that our population will before long consume more cocoa than coffee. But when we examine the details of the import returns, we find that it is the cocoa of foreign manufacture which is really making headway. The import duty on raw cocoa is 1*d.* per lb. and on manufactured cocoa 2*d.*—a protection of 1*d.* a lb. to the home manufacturer. But the increased consumption of foreign manufactured cocoa goes on in spite of this protection. When the imports of 1898 and 1897 have more than doubled those of 1896 the position becomes alarming. It is clear that the article as made abroad finds increasing favour, and there is every sign that the public taste for what may be called the new style of cocoa will continue to grow. To explain the sudden rise in the consumption of imported cocoa, we must bear in mind that the Continental article is made on a different principle from that most generally adopted in this country. In the former, the superabundant fat is reduced by pressure; in the latter, it is often diluted by the addition of another substance. We have British cocoa manufacturers who certainly have nothing to learn from Germany, Holland, or France. But, taking British cocoa all round, there is ground, at any rate, for asking whether the trade is not too conservative. Some of our manufacturers make a preparation similar to that of the Continent; but the sale is not pushed to the same extent as is that of the old-fashioned mixtures. There is no reason why our manufacturers should not make rapid strides if they care to bestir themselves. There are fashions in cocoa as in other things, and our manufacturers should be careful to study them. Are the public growing tired of the thick emulsion with which they have for so many years been supplied and giving preference to the tea-like preparation of the Continental manufacturers? Or can it be that what we see taking place is merely the result of the art of modern advertising? Whatever may be the cause, the result is too important to be lightly overlooked, and the lesson taught by the sudden change in the public taste from China to Indian teas should not be forgotten. The figures we have quoted above demand the serious attention of our British cocoa manufacturers.

DISTRICT ASSOCIATIONS.

SHEVAROYS.

Proceedings of the Monthly Committee Meeting of the Shevaroy Planters' Association, held in the Victoria Rooms, Yercaud, on Monday, the 5th September, 1898, at 1 P.M.

PRESENT: Messrs. C. Dickins, C. Rahm, Rev. J. M. Kempf, C. G. Lechler, *Chairman*, J. C. Large, T. H. Short, R. Gompertz, *Honorary Secretary*.

1. Notice calling the meeting was taken as read.

2. Copy of Plague Notice and of Collector's No. 43 of 30th ultimo (Plague) to the Deputy Tahsildar of Yercaud was read, and it was resolved with reference thereto that, in the opinion of this Meeting, it is the duty of all Planters to give the Government officials every assistance in their power in the present emergency.

3. *Resolved* that the *Central African Times* (newspaper) be stopped.

4. *Resolved* that Mr. Thurston Short be requested to go through the Book of Proceedings, noting any alterations or additions that have been made in the rules since the Association was started and submit them to the Committee with a view of framing a new code of rules embodying as far as may be the above alterations.

ROBERT GOMPERTZ,
Honorary Secretary, S.P.A.

Proceedings of a Committee Meeting of the Shevaroy Planters' Association, held in the Victoria Rooms on Monday, the 7th November, 1898, at 1 P.M.

PRESENT: Messrs. Large, C. G. Lechler, *Chairman*, Rev. M. Andersen, C. Rahm, R. Gompertz, *Honorary Secretary*.

Read letter from Secretary, U.P.A.S.I., requesting Association to pay for its copy of the *Planting Opinion*, and that it should let the Manager of it print its proceedings in future. *Agreed to.*

Read letter from Mr. Frank Mangles *re* classification of coffee.

are requested to communicate with

THE INDIA TRADING CO., Ld.,

11/12, 2nd LINE BEACH, MADRAS.

Prices on application.

Resolved that the Honorary Secretary be requested to write to the Secretary, U.P.A.S.I., suggesting that that body should try and induce curers in this country to adopt a mesh of uniform size for Coffee—A. B. C. etc.

Read letter from President, District Board, Salem, stating that the repairs of the Chembanauth road are estimated to cost Rs.435, and enquiring how much the planters would be willing to contribute.

Resolved that the Honorary Secretary be requested to forward copy of the letter to Mr. Thurston Short for favour of early reply.

Read letter from Mr. Lechler *re* the case in which a tappal cooly was imprisoned for six months for stealing a letter containing a supply bill which he attempted to cash, and suggesting that in order to check such attempts in future, planters should purchase postal bags and stamp all supply bills with the name of the estate.

Resolved that the Honorary Secretary be requested to issue a circular suggesting this.

Read and *recorded* the following letters :—

Circular from the Secretary, U.P.A.S.I., informing that His Excellency in Council believes that the Government of India has under contemplation the appointment of an Entomologist as referee for the whole of India.

Circular from the Secretary, U.P.A.S.I., regarding classification of and reduction of British tea duty.

Circular from the Secretary, U.P.A.S.I., forwarding copy letter from Mr. Acworth, acknowledging vote of thanks pass

Circular from the Secretary, U.P.A.S.I., regarding the red tion of British tea duty.

Circular from the Secretary, U.P.A.S.I., forwarding copy a letter from Mr. Frank Mangles regarding classification coffee and reduction of British tea duty.

Circular from the Secretary, U.P.A.S.I., forwarding copy letter from Mr. Frank Mangles on the classification of coffee.

Circular from the Secretary, U.P.A.S.I., forwarding copy letter from Mr. Green, Honorary Government Entomolog Ceylon, regarding the importation of lady-birds.

Letter from the Proprietor of *Planting Opinion* inform that the paper has passed into his possession.

Letter from T. P. J. Nayaratum Pillai informing that he is in a position at present to quote the price of stores.

Letter from the Superintendent of Police requesting list coffee estates on the Shevaroy Hills.

Letter from the Collector, Salem, requesting names addresses of persons willing to serve as Plague Inspectors.

Letter from the Chairman of the Yercaud Union forward copy of correspondence which has passed between the Colle and himself regarding the erection of segregation sheds.

Letter from Higginbotham & Co. informing that they order the "Journal of the Royal Agricultural Society."

HIGH CLASS TAILORING.

We have now secured the services of Mr. W. J. Marden, whose experience as a Cut and Practical Tailor extends to a period of over 20 years in some of the leading houses England and India, and whom we can, therefore, confidently recommend as a veteran exp cutter. Having placed our Tailoring Department under his control, we guarantee perf Fit and Style. This assurance, coupled with our proverbially Cheap Rates, will, we tru induce you to give us a trial order, which we respectfully solicit.

FREE CHRISTMAS GIFTS.

We are giving away 4 Bicycles and 200 useful Prizes. Numbered Ticket is given the purchase of every 2 Rs. worth of goods. Drawers of the lucky numbers will receive t prizes free.

ROYAL EMPORIUM,
BANGALORE

[w. 3-9-98—t.f.o.]

Agents for LEA & PERRINS' **WORCESTERSHIRE SAUCE.**

Honorary Secretary.

WINDING UP THE WATCH.

IT is my custom to wind my watch every night at ten. When I go to bed I lay the watch on a little table at the head of the bed. Should I chance to wake in the night I always hear the clear, distinct ticking. But one night recently I awoke and heard no sound from my faithful friend. "What!" said I, "is it possible I forgot to wind it?" To light the candle and put the watch to my ear took but a minute. Going still? Yes, going still; but very feebly and faintly. I wound it at once, of course. Then it spoke out plaintly, arousing echoes in the stillness, and to its monotonous music I dropped off to sleep.

That other watch—the watch in your breast. Ah! it doesn't do to let that run down, for, unlike the pocket watches, when *it* stops it stops, as the children say, "for keeps," for good and all.

Therefore Mrs. Susan Gladdish's statement that her "heart used to stop beating" cannot be accepted literally, She doesn't mean it so. She means that at times it beat so feebly and faintly she could hardly feel it. "It alarmed her very much," she says. No doubt. But what ailed it?

"In July, 1892," she says, "I began to feel ill. At first I felt tired and weak, without life or energy. I had a bad taste in the mouth, spitting up thick phlegm and a sour, frothy fluid. My appetite was bad, and after eating I had a sense of pain and weight at the chest. I had also frequent attacks of dizziness, and had I not taken hold of something I should have fallen to the ground.

"As time passed I grew weaker and weaker until I could barely walk across the floor. For six months I was confined to the house. The doctor said my heart was exceptionally weak. He gave me medicines and told me what outward applications to make when the attacks came on. They did no good though.

"I was in this condition sixteen months, when, in November of last year (1893), my brother told me about the benefit he had received from Mother Seigel's Curative Syrup during an illness he had been through. This made me hope the Syrup might do me good, as it had done him. I got a bottle from Mr. Wiseman, grocer, Perry street, and after taking it for a week I felt relieved. By the time I had taken three bottles I was cured, and have had no return of my trouble. Had I known of this medicine sooner I should have been spared a deal of suffering. (Signed) Mrs. Susan Gladdish, 7, Lansdown Place, Perry Street, Gravesend, January 10th, 1894."

We could quote the words of several other persons, mostly women, who have passed through an experience virtually identical with that of Mrs. Gladdish, but it is not necessary, as the comment on her case will apply to theirs.

One point at a time, then. The heart is no weakling, no tender flower that must be constantly nursed and tended. It is a tough, powerful muscle, and does more work, far and away, than any other organ in the body. All the others stop and rest betimes. The heart never does. It hammers away, year in and year out, day and night, workdays, holidays, and Sundays. It is kept going by the nerves, the nerves are kept going by the blood, and the blood is merely digested food from the stomach. There's the connection.

Mrs. Gladdish was afflicted with indigestion and dyspepsia. That poisoned and thinned her blood, starved her nerves, and made the nerves unable to give the usual strong impulse to the heart. Thus the heart beat feebly; the brain, insufficiently supplied with blood, caused the dizziness, and the *general* lack of nourishment to the whole body caused the weakness, pain, and loss of flesh. The Syrup went to the bottom of the difficulty, expelled the poison from the system, and restored the digestive powers. The food then taken gave new vigour to the nerves, and the nerves set the heart at work, vigorously, and on full time.

In other words, Seigel's Curative Syrup wound up the watch. Please remember this simple yet wonderful process.

MARKET REPORT.

COFFEE.

Messrs. Wm. Jas. & Hy. Thompson's Report of the Colonial Markets for the Week ending November 2nd, 1898, says :—

We have no change to report in this market, which continues flat for all medium qualities, and steady for fine. Brazil markets are quiet.

Futures have been firmer, and close 6d to 9d per cwt. dearer, viz. :—Good average Santos in Havre, December delivery, fcs. 37.25, in Hamburg pf. 31½, and No. 7 low ordinary Rio in New York $5.30.

Daily receipts averaged 9,500 bags in Rio, and 18,600 bags in Santos.

To-day's London official quotations are :—

	Nov.	Dec.	Mar., '99.	May.	July.	Sept.
SANTOS ...	30/3	30/6	31/3	31/6	31/9	32/3

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated November 4th, 1898, says :—

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1898-1899.	634,802 pkgs.	531,864 pkgs.	19,912 pkgs.
1897-1898.	624,391 „	558,991 „	18,487 „

50,127 pkgs. Indian
24,692 „ Ceylon
129 „ Java.
} Total 74,948 packages were offered in public auction this week.

Deliveries of Indian Tea in London during the past five months show an increase of nearly 7,000,000 lb. over the corresponding period of last year, imports being only about 700,000 lb. in excess. The stock, w on 31st May was 6,000,000 lb. above that of May, 1897, has now f below that on the 31st Oct., 1897. The extremely low prices of u Indian Teas appear to have caused a somewhat remarkable increa consumption.

Indian. The market easily absorbed the supplies at very firm rates tendency being towards a hardening in prices. The official wire give ports to U. K. for 2nd half of Oct. as 10,820,000 lb., against 10,300,0 last year ; from 1st April 91,037,000 lb. against 88,140,000 lb.

Ceylon. Competition was good for all Teas up to about 10d. per lb better grades, however, showed decided weakness, a reduction of 1d. per lb. frequently being chronicled. The official telegram gives ex to U.K. for Oct. as 6,500,000 lb., against 6,000,000 lb. last year ; 1st to end Oct. 81,000,000 lb., against. 83,500,000 lb ; estimate for Nov. 7¼ millions, against 6,750,000 exported 1897. Average for week 8 against 9·04d. same period last year.

Ceylon Tea sold on Garden Account 1st January to date 1898, 96 pkgs., av. 7·71*d.* 1897, 940,525 pkgs., av. 7·74*d.*

Java. Only 129 packages were brought forward. 1,544 package printed for next week.

IN AUSTRALIA.

The *Taiyuan* has arrived from Foo Chow with 365,000 lb. for this market. Ex this vessel business to arrive covers 1,750½ chests. At the auction sales of China sorts last week the trade made a stand against importers' demands, and business was restricted, but since the market has again become animated, and 1700½ chests have been sold. Ceylons are very firm, and full rates are being freely paid. Indians have also had good sales, 800 chests sold at 6d. to 7¾d. for common to medium, and at 8½d. to 11d. for fine.—*The Leader.*

COCOA.

At yesterday's auctions 2,795 bags were offered ; these met with a q demand, and only 2,000 bags found buyers at about previous prices.

We quote—Trinidad, middling to fine red 76s to 78s 6d, gray and mi red 75s to 76s ; Guayaquil, Caraquez 79s 6d, to 81s. 6d, Arriba 81s to 8 Ceylon, middling to fine 73s to 79s. Stock 112,083 bags, against 110, bags last year.

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N. B.—Remittances should be sent to E. C. Duft & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 9th December, 1898.

Season Reports should be sent to the Printers, Messrs. Addison & Co., direct, and not to *Planting Opinion* Office.

Yercaud.

Shevaroy Hills, 30*th Nov.*—*Weather*—Very wet and a drizzle all day, but not heavy; total for November 23·12, total for eleven months 57·49. The heaviest November we have had for many a long year. *Crops.*—Picking has been started on most estates, and planters still hope to get their estimates. *Prices.*—Rs.10 a bushel of parchment has been accepted by a few, but Chetties are not keen on buying yet.

Kil Kotagiri.

Nilgiris, 23*rd November.*—*Weather.*—Up to date this year we have had more than ten inches of rain over our average, and we have still some 40 days to go to the end of the year. To date this month we have had over ten inches with only six fine days out of the 23. *Diseases.*—Leaf-disease is showing up badly in places, and is affecting the crop slightly; the dread disease is not so bad this year as in 1896 or 1897. *Labour* fairly flush, although this heavy rain did a lot of damage; a lot of coolies bolting in the heavy rain. *Health* is good just now: may it remain so. *Crops.*—We expected a rush, and it has not come; we will get a larger one later; we have had no sun to ripen up with; it is fine to-day but cloudy: may it remain so. *Works.*—Weeding is the order of the day, and weeds are rather bad throughout the district I am sorry to say; the healthiest growth I've ever seen.

South Mysore.

Mudigere, 30*th November.*—*Weather*—Has, on the whole, been fine and seasonable, thermometer from 50° to 80°, and only two days' rain, 26th ·45, 27th ·19. *Crop.*—After this rain most places will begin regular picking, but at least one place I know of has only just begun flypicking. The rain was not regular, so other places also may be behindhand with crop, which, on the whole, promises to be well behind average in point of time. *Leaf-disease*, generally speaking, has gone, but I hear of the commencement of a second attack in one quarter. I hope it will not be serious.

A good deal depends on the wind. *Labour*—Falling off. We shall see little local labour for the next two or three months; paddy cutting and thrashing will take all their time. *Grain.*—I am told that so little ragi comes to *sante* that one may say there is none. Other things are a bit easier. Gram would have been very cheap but for the very heavy rain at the end of the S. W. Monsoon in the maidan country. Paddy crop has probably been all cut in the maidan, though it was very late this year, and is just commencing here. *Health*—Continues good on the whole. Chickmaglur has had its cholera, but I hear that this year it was promptly disposed of without spreading far. Plague, too, seems to be kept in hand, and the disquieting rumours have given less trouble of late, though anything out of the ordinary run gives rise to a small excitement. *Cardamoms.*—Crop is very nearly finished, I think, on those places which only make it a bye-product, and it has been a good one. I have no news of the larger places, but was told that the promise was good.

THE LADYBIRD QUESTION.

IN our U. P. A. S. I. section to-day there appears a very interesting *précis* of correspondence received by the Association with reference to inquiries it made on the subject of the Importation of Ladybirds. There is also a note by the Chairman, in which he advocates a double-barreled policy: (1) to employ a man to make a study locally of the disease, and (2) to import a few ladybirds by letter-post (as has been done in Ceylon). Both these suggestions are excellent, and both will stand a little amplification. It may be remarked concerning the first that the man employed would have an opportunity not merely to study the disease, but to study a possible antidote, the *indigenous* ladybird. A few specimens of this are in the hands of the Secretary of the U. P. A. S. I., but their species has not yet been identified, and in the absence of anyone in Madras with the requisite knowledge and leisure to undertake the work, they may have to be submitted to Mr. GREEN, of Ceylon, or some other entomologist outside Southern India. Further specimens could no doubt be easily collected, and it would probably save both expense and time if the man selected to fire No. 1 barrel of the Chairman's gun were to be intrusted in the first place with specimens of indigenous ladybirds, so that he might know what, if any, "remedies" or "antidotes" are available *on the spot* in particular districts. When, subsequently, he visited any one or more of these districts, the knowledge he had thus acquired might be turned to account. There cannot be a doubt that among the varieties of Indian ladybirds one, at least, is likely to be an enemy of the green bug. Once identified, this particular ladybird might be "cultivated," and the risk, expense and trouble of importing *coccinellidæ* from abroad be avoided.

Perhaps it may help some enthusiastic planter to make a few selections, if we describe a few of the chief varieties that have been mentioned as likely to be found natural enemies of the coffee-planter's natural enemy, the *lecanium viride*. First, then, the *Rhizobius ventralis*, of which Mr. H. O. NEWPORT brought specimens from Queensland. This is a black ladybird, measuring between one-eighth and three-sixteenths of an inch in length and about three quarters as much in width. The body above is covered with a fine light pubescence, which gives the insect a grayish appearance. It is reported to be a general feeder upon scale insects, but to be particularly fond of *Lecaninæ*, or soft scale. Next, let us refer to a much larger speci the *Orcus australasiæ*. The beetles measure from thr sixteenths to a quarter of an inch in length, and are nea as broad. The colour is a bright deep blue, and the wi cases are marked with six reddish spots, four in a r across the front, and the other two behind, side by si Third, comes the *Leis conformis*, a little larger still, bei generally a quarter of an inch in length. It is yellow colour and bears twenty-two black spots on the dor surface. As the beetle grows old the yellow gradua changes to red. The above brief descriptions are tak from the report of the Cape Government Entomologist 1895. Mr. NEWPORT gives a similar description of t *Rhizobius ventralis*, except that he seems to consider it s smaller than would appear from the above. The *Orc australasiæ* he describes as almost round, and black, w three red spots on each wing case; smooth and shi He also describes a fourth insect, the *Cryptolæmus m trouzerii*, as much smaller than the Orcus, and much long than it is broad; its wing-cases are black and distinc hairy, but the thorax is of a dull orange yellow.

Now, as regards the importation of ladybirds from abro all we would urge is that there is no reason why t experiment should be confined to Queensland. Mr. HEN TRYON, the Entomologist there, has certainly had t advantage of discussing matters with Mr. NEWPORT, w would doubtless give him a very clear idea of what wanted. On the other hand, Mr. LOUNSBURY, the Entom logist at Cape Town, has transmitted *coccinellidæ*, w partial success, to Mr. E. E. GREEN in Ceylon. Th too, the Californian entomological authorities have h experience in supplying the Cape and Australia and oth places; and were, in fact, the first to start the system "international trade" in Ladybirds. It would be w therefore, we think, to give a trial to more than o country. At the same time, whatever is done in the w of importing ladybirds *by post* must be done with extre care. The insects will have to be provided with fo on the way. That food may possibly have to cons of pests of some kind. On arrival, due precautions must taken to prevent a spread of pests simultaneously with t propagation of ladybirds! This is the chief reason why is so desirable that an entomologist— not merely a plant however watchful—should be in readiness to receive t imported ladybirds and attend to their propagation. is at all times a ticklish thing for man to try to interf with "the balance of nature." It is mainly perha because he does so recklessly in regard to plant life, th disturbances of the animal world have occurred to give h trouble. Green bug becomes too plentiful because it afforded exceptional opportunities for propagating species. Try to remove these and exterminate the bu and the result may be an over-development of so other insect which, in turn, will prove harmful in some wa In short, the full effects and influence of encouragem of a particular species of insect cannot be foreseen. much the more need, therefore, for extreme precaution.

COFFEE STEALING.

WHEN the subject of coffee-stealing was discussed at t last meeting of the U.P.A.S.I., the only result was t passing of a resolution expressing regret at the delay th

had occurred in regard to dealing with the report of the South of India Planters' Enquiry Committee. This delay continues. So, no doubt, does Coffee-stealing. Might it not be well, therefore, for planters to try to adopt some remedial measures, in anticipation of any new legislation that may eventually be introduced? The report of the Enquiry Committee did not accept some of the chief suggestions put forward by planters. Its conclusions on the subject of Coffee-stealing may be summarised as follows :— That the provisions of Sections 5, 6 and 7 of Act VIII. of 1878 (Madras), which apply to purchasers of coffee, should also be made applicable to sellers. (Then, all growers who also deal in coffee would be bound to keep registers showing particulars in reference to sales of coffee corresponding to those now required for purchases, and it would be easy to ascertain the amount said to have been obtained by the dealer from his own garden or by purchase, and its disposal.) That, with a view to the ascertainment of the amount really produced at the dealer's garden, a section should be added to the Act by which the Madras Government may take power to prescribe forms for such books, entries, statistics and accounts as it may think necessary to be kept, made or compiled in Revenue offices or submitted to any authority, and by which also provision may be made for compelling the owners of all coffee-gardens to submit returns of coffee crop and to afford all reasonable facilities to karnams and others properly empowered for verifying such estimates and obtaining the information required in the forms referred to above.

It would be unreasonable for planters to expect at the outset *more* than the Committee has recommended, and it may be that they will get *less*. Is it to be supposed that the proposed measures will alone suffice to stamp out coffee-stealing? The Committee attached great weight to a remark in a report of Mr. Fawcett to the Inspector-General of Police, Madras, dated 10 January, 1895 : "The planters have it in their power, it may be added, to prevent all thieving on the road, a kind of thieving by which they have always lost very largely and which the police can never cope with quite successfully unless the planters do more to help themselves." Questioned regarding the precautions taken by planters to prevent thieving of this kind, Mr. Fawcett stated : "Some take none, sending coffee in carts in bulk just as if it were gravel; some seal the bags, common gunny bags easily broken into; and some few use the seamless bags sealed and packed within other bags, a plan which renders theft without discovery impossible. Some send part of a consignment thus, part in ordinary gunny bags, that in the seamless bags being available for check for the rest." Even if effect be given to the recommendations of the Committee of Enquiry, there will be as great need as there is now for precautions on the part of planters, and apart from any question of registration (which may well be left over for consideration after the Committee's report has been dealt with by Government) planters would certainly do well to consult together and try to adopt systematic and, as far as possible, uniform measures for the prevention of thefts. Mr. Jno. G. Hamilton gave some useful hints on the subject of coffee-stealing at the annual meeting of the South Mysore Planters' Association in March, 1897 (*vide "Planting Opinion,"* 1st May, 1897), and these would form an excellent basis for discussion of the subject generally and consideration of desirable preventive measures. Only the other day a similar question was considered by the Committee of the Planters' Association of Ceylon, which resolved that Government be asked to issue instructions for special vigilance amongst Government officers and native headmen in all districts, where cocoa and all low-country products are cultivated, as the Committee considers that those estates are specially liable to depredation during the crop season now coming on.

TEA.

WHEN writing week after week about Tea, it is with ever-increasing regret that we find Ceylon always in the first place. There is more said about Ceylon, and the news available is of more interest, than anything current about India. Ceylon is the superlative, Northern India the comparative, South India the meagre positive that barely escapes being termed a negation. Yet we continue to refer to Ceylon Tea because in the reports from representatives in America and Europe there is so much from which South Indian tea-planters *can* learn a lesson, if they will. There is very little doubt that Ceylon has for the moment solved the problem of the effect of demand upon values. We need have no fear of overproduction just yet while catering to meet the tastes of Australia, and America, Russia, Germany and other markets. Can the same be said of South India? In Travancore production is being rapidly extended. What about demand? True, Travancore—along among South Indian districts—has co-operated with the Indian Tea Association in regard to efforts to extend demand in the United States and elsewhere; but that is scarcely enough to place her on a level with Assam, for instance, which has a potent voice in the deliberations of that Association. We cannot but feel that in this matter of Markets, South India's interests are not well looked after. Perhaps the feeling is that the community down here is not wealthy enough to bear the strain of advertising and other expenses such as are incurred by Ceylon and the Indian Tea Association. Yet a little spent now might save a good deal of expenditure later. *Verb. sap.*

PRIZE ESSAYS.

To promote and stimulate the dissemination of information on subjects relating to the planting industries, and to encourage discussion on such subjects, we have decided to start a series of prize-essay competitions. The scope and duration of these will largely depend upon the manner in which planters respond in the first instance. If a fair number are willing to enter the lists, we will keep these open, selecting various subjects from time to time and doing all in our power to make the results interesting and instructive to readers. As an opening subject we select

THE LABOUR QUESTION.

THE PAST, PRESENT AND FUTURE SUPPLY OF LABOUR IN THE———— DISTRICT.

For the best essay on this subject from any planting district in Southern India, we offer a prize of Rupees one hundred.

The following few simple rules should be observed by competitors :

1. Write on one side of the paper only.
2. Give your name in full, and state address (not for publication, except in the case of the winner.)
3. Be as brief and concise as possible.
4. Cite your authorities where possible.
5. Mark your MSS., "Prize Essay Competition."
6. Submit not later than 14th January, 1899 (in Madras).

It should be clearly noted that all essays sent in will be the absolute property of *Planting Opinion*, and that the proprietors will have the right to publish them, in full or abridged or revised, in *Planting Opinion* or elsewhere, and to republish in pamphlet or book form. No limit of length is fixed, but brevity is strongly urged, and diffuseness will greatly prejudice an essay's chance of being a prize-winner. Every competitor should strive to be *accurate* and *concise*. Rupees one hundred will be remitted to the winner immediately after publication of the prize essay. It is hoped that contributors from all districts will compete, so that a really comprehensive series of papers may be forthcoming.

If the response made to this invitation be satisfactory, early intimation will be given of another prize competition.

NOTES.

Foreign Orders and Tea.

Ceylon and Darjeeling both execute Continental orders. Are any such known in this part of the world?

Tea in Northern India.

According to the Assam annual report on tea, Sylhet is well to the front in the yield per acre, although this year both it and Cachar will not do well.

A Ceylon Tea Factory burnt down.

The Tea Factory on the Knavesmire estate was recently destroyed by fire. The property is said to have been fully insured.

Ceylon Exports.

Tea exports are altogether 104,985,013 lb., being 4,715,325 lb. more than at the same date last year; while to the United Kingdom, the comparison shows a falling off of 1,685,767 lb.

Exports of Tea.

The total exports of Indian tea from Calcutta from 1st April to 31st October, 1898, to all ports is now given by the Indian Tea Association at 9,744,846 lbs. against 91,056,357 lbs. in 1897. The exports of Ceylon tea from January to 1st November were 100,285,557 lbs. against 94,386,042 lbs. in 1897, the increase being about the same as in the case of Indian tea.

The rise in Cinchona.

The *B. & C. Druggist* observes:—Quinine is the chief topic of conversation this week in London (November 10th) in our markets so far as the articles then dealt in concern us. Practically all the makers, except the leading English one, have ceased selling at last week's prices, but no official advance in the "combination" figures has been made. Cinchona Bark advanced over 1-16*d.* per unit at the London auctions on Tuesday.

Sinhalese Labour for Travancore.

The *Ceylon Observer* of 25th ult. reports:—"This afternoon Messrs. Finlay, Muir & Co. sent away between 50 and 60 Sinhalese by the B.I. S.S. *Hin en route* for Ammanayakanur, Travancore, where they w be engaged on building operations." The mild Tamil m evidently look to his laurels. We should say the Exchan comparing plantation cooly wages with carpenters' wag in Travancore, is decidedly "against India."

Russia and China Tea.

The Chemist and Druggist me tioned recently that Russia had eye on the tea trade. Matters have got to such a po that a continental official paper says that the completion the Siberian Railway will take the exportation out of t hands of the English, and give it to Russian merchan who will place it on the market at fifty to sixty per ce less cost. The tea will go to Irkutsk (South Siberia) land carriage, thence by the Siberian Railway, and Easte and Central European goods will be taken as return freig

Liberian Coffee in North Borneo.

The *North Borneo Herald* observes The first parcel of this year's cr of Liberian Coffee from Taritip Estate has been sold in Singapore, for $20.70 per picul clean coffee, a decided and welcome advance on the $17 at which some of the last crop was sold. Messrs. Guth & Co., when advising the sale, said:—The Coffee marke steady; supplies small and likely to continue so. We no reason to anticipate any decided fall while supplies co tinue to come in so sparingly.

Ceylon Tea for Russia.

The *Ceylon Observer* learns th the Russian buyers have been buyi freely in the Colombo market for some time, and says, four distinct firms are establishing branches in Colombo is evident that they mean "business," and see a future the Colombo trade. If we are not greatly mistaken, sa our contemporary, our direct exports to Russia next year w show a very consideraeble increase. Our informant h heard "10 million lb." estimated as probable, and adds: "I really don't think this will be far out."

Calcutta Tea Sales.

At the sales on 25th ult. 19,0 packages were sold. The gene quality of the sale was less attractive than recent offering owing to the large proportion of poor liquoring teas fr Cachar and Sylhet. There was less demand for all grad excepting a few fine lots; and prices declined a quarter a half anna on all teas worth over six annas, and two three pies on all teas under that value. Owing to t recent heavy shipments to the Bombay market, there w less support than usual from this source.

Colombo Tea Sales.

At the public sale of tea Colombo on the 22nd ult., abo 7,798 pkgs. = 630,977 lb. were offered, of which abo 5,540 pkgs. = 451,211 lb. were sold. A somewhat weak tone prevailed at the auction, this being most noticeable common and medium broken pekoe. Competition for le teas was well maintained, and prices though irregular we generally about previous rates. Amongst the finest te in the sale were: Queensland, Monkswood, Glasgow, Ag Ouvah, and Anandale. Amongst the low-grown teas go invoices were offered from Bokotua, Talgaswella, Clyd Putupaula, Eila, and Neboda. The last sale this year w

be held on 21st inst., after which there will be no sale till Thursday, 5th January, 1899.

Jadoo, Limited. According to the *Gardeners' Chronicle* :—The third annual meeting of the shareholders in Jadoo, Ld., was held at the offices of the Company, Palace Gate, Exeter, on Wednesday, October 26. Col. Halford Thompson presided. The Company, as we learn from the report of the meeting, is pushing the business in Continental countries, and in the colonies, but the turnover was small, and seems scarcely satisfactory : and, as the Chairman said at the meeting, the sum of £4,000 to £5,000 was required to still further develop the concern. They were, however, enabled to recommend a dividend of 5 per cent. per annum upon the paid-up capital. The sum of £200 1*s.* 4*d.* would be carried over to next year's trading.

The London Tea Market. Telegraphing to Colombo on 24th ultimo, Messrs. Gow, Wilson and Stanton reported that the market generally was steady, for teas with quality weak, while the market for poor liquoring teas was also steady. The price of fair liquoring Ceylon Pekoe Souchong was 6½*d.* and the average 8¼*d.* (the former the same as last week and the latter a farthing down). Reuter reported :—Tone of Ceylon Tea.—Common to medium kinds firm, others remaining quiet. Fair Pekoe Souchong he quoted at 5½*d.* (same as last week) and the average 8⅜*d.* (⅛*d.* down), 21,000 packages of Ceylon tea were offered for sale, of which 20,000 sold. Of Indian tea 49,000 packages were offered and 44,000 sold. The average was 8½*d.*, which shows a rise of ⅛*d.*

The Tea Duty in New South Wales. There has been a rush of clearances in Sydney, in consequence of the imposition of a duty of 3*d.* per lb. On the 8th ult. the market was in an excited state, and a general rush was made on stocks, with a desire to operate at something near ante-tariff rates. Taken as a whole, the market may be said to have advanced about 2*d.* all round for spot stocks. New shipments will necessarily have to pay the full complement of duty. In some instances sales were made with the proviso that, in case of the duty being removed, buyers will have the full benefit of the reduction, but, as a rule, buyers preferred to pay a slightly lower figure and take the responsibility. Sales were mentioned of over 2,000 packages of Chinas from 6½*d.* upwards, and 200 packages of Ceylon were placed at 10*d.* to 1*s.*, and 200 Indians at 9*d.* to 11*d.*; 50 packages of Pekoe Souchong sold at 6*d.* f.o.b.

The British Tea Duty. In a "communicated" paper in the *I. P. G.* we read the following :—China tea bears a heavier handicap than Indian, and long may this prevail; were the duty abolished, no doubt large quantities of inferior leaf would find their way into the markets, and were tea to become a non-excisable commodity, a wide door would be thrown open to re-driers of old and manufacture of spurious leaf. On planters' account, therefore, we are decidedly in favour of retention of the impost, both in the interests of producers and consumers. From strict enquiries made, we cannot agree with the opinion that there is a probability of the revival of China tea, and, as for competition from non-British growing sources, have pointed out, we consider conclusively, that no country can compete with India in tea growing owing to her possession of cheap labour.

Cacao Disease. Mr. J. B. Carruthers writes to the Colombo Press to explain an apparent misapprehension as to the fruit disease of Cacao. He says :—There is an entirely distinct fungus affecting the pods in addition to the canker fungus. I did not state in my reports that the canker fungus did not spread to the pods, as it is only recently that I have been able to be working with the trees in fruit to any great extent. This is not a new development of the canker, though we have only recently been able to observe and investigate it. I hope to explain this in my additional report. The methods prescribed to be used for the prevention of the fungus in the pods are the same, whether the fungus is one species or another. I do not consider that if measures are taken, as advised in all the reports, to destroy the pods with any sign of disease that cacao planters need view with any additional alarm the fact that the canker fungus spreads into the pods—indeed; it explains to a great extent the rapid increase of the canker on some estates at certain seasons of the year, and gives us reason to hope that now that we know what to do to combat it, we may be able more quickly to get rid of our enemy.

Close Plucking and Quality. Mr. A. Cooke writes to the *Planter* :—I believe that there is an idea that the tea leaf does not get to its best quality until the shoot is matured and has several leaves on it. But I dispute this, and I think that the leaf is best when it is still imbedded in the axil. The best Broken Orange Pekoe consists of these buds which are hardly visible on the shoot, but are released in the firing. And I think that two leaves and a bud are richest in quality as soon as the second leaf opens and shows; the bud each day after this increases the weight, but detracts from the quality of the shoot, until it has become three leaves and a bud, and I base my argument on the fact that when the shoot has stopped growing and become *bhanji*, the topmost two leaves are not good quality. I imagine that the quality of two leaves and a bud decreases according to the number of leaves below them, because, after growing three, four, five or more leaves (according to strength of the shoot), it grows *bhanji*, and then all know the *quality* is gone. For this reason I think it important to get round the

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain per ton :—

61·50	lbs.	Nitrogen.
57·38	„	Potash.
14·92	„	Lime.
13·68	„	Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the 1898-1899 crop of seed from the parent trees of above analysis at Rs.6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the

MANAGER, ARIENKOW ESTATE,
Shencottah.

plucking in five days, so that no leaves are grown below the two leaves which are taken.

Pepper. The *London Commercial Record* makes the following interesting remarks, after observing that pepper has been "tightening":—It is generally felt, not only in London, but abroad as well, that the small supplies which are likely to reach our markets this season from almost all pepper-producing countries will not fail to have a strengthening effect on Pepper prices. The steadily declining shipments from the Straits have, no doubt, been responsible for the enhanced range of values, and the crop reports this season from that part are again favouring bulls. Tellicherry black, which seems destined to take the place of black Singapore in time, will, it is feared, experience a part crop failure, as the absence of rain has prevented a full development of the young crop. Instead of 4/5,000 tons, it is estimated that the yield will not exceed 3/3,500 tons, which, having regard to the fact that there are practically no stocks left—contrary to other seasons—must be considered a small crop, particularly as India will, through the failing supplies of Straits sorts, probably require more Tellicherry pepper than ever. From January to September this year the total exports to Indian ports amounted to about 3,000 tons as against 1,200 tons taken for shipment to Europe.

GENERAL ARTICLES.

THE U.P.A.S.I. SECTION.

[UNDER THE CONTROL OF THE SECRETARY, U.P.A.S.I.]

THE following is from a marked copy of *The Chamber of Commerce Journal* kindly sent from London, and relates to the deliberations of the London Chamber of Commerce:—

Coffee and Cocoa Trade Section.—Meetings of this Section were held on October 3rd and 10th, Mr. Robert Wales, Chairman, presiding. Mr. Wales and Mr. Hahnemann Epps were unanimously re-elected Chairman and Deputy Chairman respectively. The question of the contents of H.B.M. Consuls' Reports was considered with a view to suggesting special information regarding trade which it was desirable to obtain. The Section was of opinion that the delay in these reports reaching the public rendered them of little practical value, and they suggested that information as to the acreage of coffee and cocoa in cultivation each year and as to the shipment thereof from the various ports might be obtained. A communication from the United Planters' Association of Southern India regarding the classification of coffee was considered and referred to the General Produce Brokers' Association of London. A lengthy discussion took place in regard to the high dock charges on coffee and cocoa, and the paucity of import these articles into London compared with the import Continental ports, and a large and representative Dep tion was appointed to wait upon the Directors of the D Company to urge the necessity for a reduction of the ra

APPENDED is a *précis* of sundry letters received on subject of Ladybirds, together with a note by the Ch man:—

From Mr. W. T. Thiselton Dyer, dated Kew, 15th September, 189

This letter is founded on a total misapprehension of the ac facts of the case. Mr. Dyer says that the costly experiment foredoomed to failure from the first, because we acted "under impression that any ladybird would attack any scale." Sugg consulting Dr. Bourne.

Prof. Blandford, 48, Wimpole Street, London, W., 18th Sept., 18

Suggests consulting Mr. Ernest Green of Ceylon and the S Entomologists of America, or of such colonies as have made ex ments; also suggests "that as the arrangements entered into Mr. Tryon seem to allow scope for experiment with different cons ments, it ought not to be difficult, even without expert advic arrive at the conditions necessary for success."

Points worthy of consideration: (*a*) the particular brood sele for exportation, which should be preferably one that norm hibernates, (*b*) the length of time elapsing between capture of insects and refrigeration; if not frozen at once after capture, ins should be fed to keep up their vitality; the temperature shoul lowered gradually, and insects provided with moss in whic hide themselves, as in hibernating under natural influences an thawing out *E. converso.*

Fluctuations of temperature, provided it does not rise above critical point, are probably immaterial. If the insects are once warm they must not be again exposed to cold, but must be fed, and for purpose a Wardian case with scale-infested plants should be u care being taken not to import a dangerous species of scale. importation of ladybirds in these Wardian cases might attempted concomitantly, care being taken not to allow the scal escape on arrival and the plants to be burnt and cases disinfecte

Rodolia iceryæ, a South African ladybird, has been successf shipped from Cape Town to New Zealand (passage 21-22 d simply by putting the insects into a bottle with plenty of "bugs feed on; Mr. Koebele's importations from Australia to Califo were, it is believed, also partly conducted without refrigeration. these cases it is not necessary to collect perfect insects, but la could be shaken into a beating net. Prof. Blandford has rece live insects from India, West Indies and S. America by post, ladybirds might similarly be sent from Australia to us in ventil boxes supplied with scale and with loose soft packing on the outs

Suggests the scientific study of the relationship of ot predaceous insects to the *Lecanium viride.* To import the ascertai enemy of a particular scale in its own home is justifiable, but wholly speculative to introduce a species of insects which are actually known to prey on the kinds it is intended to destroy, w Prof. Blandford imagines to have been the case with us.

Imported varieties only flourish if there is an entire absenc any indigenous insects of the required capabilities, or if the impo variety have greater predaceous activity, or possess in their home a capacity for multiplying and flourishing which the indiger varieties do not possess, as is the case with some of the ladyb imported to America. This probably applies with still greater f to the Hawaiian islands, under the well-known rule that introdu species tend to become dominant in islands, owing probably to limited indigenous fauna. But there is little evidence to show this would be the case in India. It is therefore desirable to study indigenous enemies of *Lecanium viride.*

What is the natural home of the scale? If in Ceylon, its in enemies should be studied there. Possibly the remedy is at door of the mischief.

From the Secretary, United States Dept. of Agriculture, Washingt 16th September, 1898.

Suggests that as Mr. E. E. Green, of Ceylon, is already experim ing on the subject, his advice should be asked.

R. VENKIAH BROS.,

NOTHING EQUAL TO THESE IN THE CARNATIC.
[2-10-98—t.f.o.]

The experience of the United States with imported ladybirds is briefly as follows:—In 1888 a ladybird known as *Novius Cardinalis* was introduced from Australia which almost completely destroyed the white scale, an insect which was ruining the citrus growing industry of California. Later, Mr. Koebele, under the auspices of the Californian Board of Horticulture, brought over a dozen kinds of ladybirds, the most valuable being *Rhizobius ventralis*, a very effective enemy of *Lecanium oleæ* which was attacking the olives in California and subsequently introduced the *Cryptolæmus Montrouzieri* to the coffee plantations of Hawaii with success. The department has also sent successfully the *Novius Cardinalis* to Alexandria, where it destroyed a scale pest attacking the figs and to Portugal, where it destroyed the white scale attacking the citrus plantations. Summing up, he says that these experiments show that great good can be done where the plant is itself an introduced species and its natural enemy can be brought from the country of its origin, but unfortunately he does not state in any one case how the predatory insects were imported.

From the Royal Agricultural Society of England, Zoological Laboratory, Cambridge, 3rd Sept., 1898.

Regrets that they can give no special information, but remarks that if the scale pest is imported, the plan would be to ascertain wherefrom, and seek the ladybirds from that quarter.

From Mr. Lounsbury, Cape Town, 29th September.

Begins by warning the Association against being too sanguine of successful results from the colonisation of exotic *coccinellidæ*. The subject is complex, including not only the relation of the injurious insects to their enemies, but also the relation of the insect to its plant food, and the relation of both insect and enemy to climatic conditions and other factors. Has been trying for three years to import species to alleviate their scale-insect sufferings, to get a natural enemy to subdue their *Diaspinæ* pest as the *Novius Cardinalis* has subdued the *Icerya purchasi*, but has little hope of success. Like former writers, he says the proper way of setting to work is to find out where the pest comes from, and then to seek its natural enemies; but this requires a wide knowledge of the whole subject and unlimited funds. An inferior, but easier, plan is to secure from similar climates species whose establishment is known can do no harm and may do good, the theoretical advantage being that new enemies to the pests are introduced which have been relieved of some of their checks and which, therefore, may multiply exceedingly and prove correspondingly beneficial.

As to transport, in cool waters and with careful attention, possibly the best plan is to send the insects on scale-infested plants in Wardian cases on deck; secondly, as advised by the U. S. A. authorities, to pack the insects with a plentiful supply of food interspersed with dry moss in a wooden box wrapped in stout paper, in a cool chamber of uniform temperature of, say, 40 to 45 degrees; thirdly, by letter post. He has sent a consignment of *Exochomus nigromaculatus* to Mr. Green in Ceylon in this manner. (*Vide* Mr. Green's letter dated 19th October.) Finally suggests that we should study already existing *coccinellidæ* of Southern India.

Letters from the Royal Microscopical Society, Hanover Sq., London; Royal Agricultural Society of England; Royal Society, Zoological Society, Dept. of Agriculture, Brisbane.

Are of no interest.

From Henry Tryon, Dept. of Agriculture, Brisbane, 21st Sept., 1898.

Considers that *Cryptolæmus Montrouzieri* will prove eminently serviceable in coping with mealy bug; it has done good work in the Sandwich Islands, and is readily obtainable in Queensland. That the insects should be landed in Colombo under the supervision of Mr. E. E. Green, and thence distributed with regard to transport, in a somnolent condition induced artificially by cold. Has nothing to add to the information already given to Mr. Newport. Is still convinced that it is practicable. As an alternative procedure, feeding the insects *en route* is worth considering. For this purpose a food supply should be established at Colombo, if no endemic species of mealy bug be prevalent there, *Dactylopius Aurilanatus* should be established, as it exclusively affects Auricaraceous plants and could readily, therefore, be kept under control. To forward the beetles to Ceylon, Auracara Bidwilli pines, infected with its special Dactylopius, should be put in securely closed plant cases with the Cryptolæmus ladybird.

Larvæ cryptolæmus should not be sent for fear of forwarding at the same time the Cryptolæmus hymenopterous parasite which would make the experiment barren of result. It would be moreover expedient to collect and remit the beetles shortly after they have hatched out from the chrysalis so as to get the full term of their existence in the imago state. November is the best month for collecting. Mr. Tryon ends by recommending the Association to employ a trained entomologist, though this conclusion is not to be regarded as in any way disparaging the efforts made by Mr. Newport, for he must highly commend the zeal displayed by him in the work that he undertook.

From E. E. Green, Honorary Government Entomologist, Pundaluoya, Ceylon, 19th October.

Reports the arrival of a consignment of the ladybird *Exochomus nigromaculatus* from the Cape of Good Hope, packed in moss in a wooden box with an ample supply of food and sent by post. They arrived in four weeks' time.

Five living beetles and four young larvæ, evidently born on the voyage, were discovered to be alive; of these three beetles and two larvæ died soon after arrival. The rest are healthy. He considers that this experiment proves that ladybirds can be sent successfully by letter post, especially from Australia, whence the transport is shorter. Advises the inclusion of as many larvæ as possible. The food supplied was cochineal insects (*coccus cacti*) upon branches of the prickly pear (*opuntia*)—a judicious choice, as the insect is restricted to this one plant and, therefore, not likely to become a step.

He has been feeding his beetles upon *Lecanium viride* and *Pulvinaria psidii*. They prefer the large egg masses of the latter, but also wipe out numbers of the young larvæ of the lecanium and would, he thinks, readily subsist on lecanium, in the absence of other scale insects.

From A. G. Bourne, Adyar, 30th October, 1898.

Regrets that owing to press of work he is unable to carry on investigations. It would require long and careful investigation on the spot.

But he might be able to train and depute one of his old students to work on the spot and send him specimens. If this was done, and such a man secured, he would require a small salary in addition to expenses.

He thinks that the fungoid growth discovered by Mr. Hodgson deserves further careful investigation.

From E. E. Green, Pundaluoya, Ceylon, 5th November, 1898.

Commenting on Mr. Lounsbury's letter, says that he is quite right to warn us not to be *too* sanguine of success, but the possible benefit is well worth the risk of failure. He thinks we should try different parts of the world, preferring those of somewhat similar conditions of climate.

Where we have to deal with extensive areas under a single product artificial treatment is really impracticable, and that our only hope lies in natural remedies.

In continuation of his former letter, adds that a few young larvæ have recently appeared in his breeding jars. He hopes to be able to rear these and to obtain a third brood.

From the Secretary, Horticultural Department, State Board of Horticulture, California, 26th October, 1898.

They were the first to take hold of this matter, at a time when the question of importing beneficial insects from other countries was unknown. Believing that they could accomplish great good by introducing the natural enemies of all scale insects that had been imported upon plants, trees, &c., they sent an expert to Australia and adjacent countries, whence he sent numerous beneficial insects, some of which proved eminently successful.

From the General Secretary, Agricultural Bureau, South Australia, 2nd November, 1898.

They have numerous *Leis conformis*, *Rhizobii*, *Novius* (or

FOR SALE.

Hybridised Maragogipe Coffee Seed. Rs.50 per bushel.

Apply to J. G. FINDLAY, Esq., *Coonoor.*

[w. 3-12-98—17-12-98.]

Vedalia), &c., but no Entomological department nor any means for collecting. Generally speaking, these agencies keep indigenous *coccinellidæ* in check, but they have had trouble with imported species which have been introduced without the enemies which prey upon them. They have not succeeded in introducing the fungi, bacilli, &c., which in some countries keep insect pests within bounds, and they find that most natural agencies require *special* climatic conditions. The one absolutely effectual destructive agent, in regard to individual trees affected with scales, is fumigation with hydrocyanic acid gas under an air-tight tent.

Note on this Correspondence by the Chairman.

As all the great authorities consulted are unanimous in suggesting (at any rate as a concomitant measure) the study of the indigenous enemies of the *Lecanium viride*, it seems to me that our first step should be to accept Mr. Bourne's suggestion and to employ one of his students in studying some estate badly infected on the Pulneys or Nilgiris. Secondly, I would suggest, as it will cost but little, to ask Prof. Tryon to send a few consignments by letter post and have them addressed direct to some gentleman in the infected districts, who would undertake to help out the experiment. Possibly Mr. Bourne's man would be the best to employ for this purpose.

But obviously from Prof. Tryon's letter, if anything is to be done this season, it should be done at once.

(Signed) GEORGE ROMILLY.

'CHEESY' TEAS.

THE following letter has been received by the Secretary o Indian Tea Association, London, from the London Wholesale Dealers' Association :—

ERNEST TYRE, Esq., *Secretary, Indian Tea Association, Londo*

DEAR SIR,—Reports have reached my Committee that some have a cheesy taint, and in certain instances have consequently thrown up.

From exhaustive inquiries made, it is supposed the cause of cheesiness is that the wood used in the manufacture of the pack is sometimes put together in a green state, and the action of heat causes the sap to exude, which sap working on the lead li produces the cheesy smell in the wood and lead.

This injurious effect may take place either during the trans of the chests from the gardens to Calcutta, or in the hold of steamer during the voyage to England.

This fault is not found in metal packages, or in chests made wood imported into India from Japan, as such wood is thorou seasoned before the packages are actually made up at the garde

Another matter respecting dust teas has also caused consider inconvenience, by the chests being in some instances so inse that carriers refuse to take them on account of the claims for l age.

I am, therefore, desired to ask if your Committee could kindly their way to induce importers either to adopt better seasoned w to meet the first case, and in the matter of dust teas to have t packed in some well-tested and approved metal chests.—I am, Sir, yours faithfully, R. SEDGWICK, *Hon. Secretary, London Whol Tea Dealers' Association.*

COFFEE IN SOUTH SYLHET.

THE Correspondent of the *Planter* writes: October prices rulin London show a large range between the highest and the lowest f 30 shillings to 150 shillings per cwt. On the face of this a re valuation of South Sylhet grown coffee of 104*s.* per cwt. is very s factory indeed to those planters who had suitable land and plant with this product. Some few weeks ago I alluded to a row of c bushes in a bungalow compound that I had known for the last years and which had been fruiting heavily every year, and had sh no signs of disease. I had the opportunity a few days ago of exa ing the same bushes and measuring them. I found them to ave 9 feet in breadth and 7½ feet in height. The shape is a pyrami and as near perfect as you could expect a bush to be which has l left largely to its own resources. All the crop had been taken and although the manager could not tell me exactly how much t were of it, as he had only taken over charge a few days befor was informed that it was a very heavy one. Still they had not slightest appearance of exhaustion, with the exception of three of bushes which were growing under the shade of a gigantic lime t and any one who knows the excessively voracious appetite posse by this tree as well as the ramifying power possessed by its roots, not be surprised at these three bushes not looking so strong as buches growing further off on each side. None of those bushes (w the exception of the three alluded to above) were under shade, an far as I have been able to judge from the coffee I have seen grow in Assam and Sylhet, shade is not required if the bushes are growing upon teelas. When planted on teelas, shade, I believe absolutely essential, as well as mulching at the commencemen the dry weather. . . . It is hardly credible that a crop of c does not take so much from the soil as an ordinary crop of tea, from the analyses by experts of both products, this would appea be the case. According to Mr. Hughes' " Coffee, Soils and Manur the constituents removed per acre by an average crop of co assuming 7 cwt. of parchment from 1,200 trees, would be—

Potash	10·6	usually present in soils in only limited quanti- ty.
Lime	1·5	
Phosphoric Acid... ...	2·1	
Nitrogen	11·5	

These figures do not include what is contained in the pulp and lea as these are not taken off the garden but returned to the soil.

MILLIE & REDMOND, late P. THOMPSON & CO., *Ootacamund, Engineers and Contractors.*

The amount of these four most essential constituents removed by six maunds of manufactured tea, which we may take to be an average outturn per acre, according to Mr. Bamber, is as follows :—

Potash	12·16
Lime	2·72
Phosphoric Acid	6·72
Nitrogen	22·00

Taking the aggregate of these figures, tea takes about double the quantity of those constituents per acre from the soil that is removed by coffee.

GRAFTING CACAO.

Mr. J. H. Hart, F.L.S., Superintendent of the Trinidad Botanical Department, writes :—

It has on more than one occasion been asked whether it is possible to graft *Theobroma Cacoa*, and hitherto I have not been in a position to reply in the affirmative. I have now to report for the information of the Society that experiments have been carried out at the Royal Botanic Gardens by inarching several varieties of Cacao upon young seedlings with all the success that could be desired ; and I hope that the grafted plants will be sufficiently hardened to be shown at the next meeting of the Society. The course pursued has been to inarch a branch of a desired variety upon a well-grown and healthy seedling, and the result has been that the union has taken place very freely, and there can be little doubt that in future any desired kind or variety can be perpetuated by this means.

I desire to point out the opening this process will afford for the extensive planting of any desired variety or kind, and that it will enable the planter to put samples of Cacao upon the market with less variation in size and quality of the bean than has hitherto been possible.

I also desire to point out that it may be possible, as it is with apples and pears in a temperate climate—by grafting weaker growing varieties upon kinds having a larger amount of vegetative vigour—to increase the yield of such kinds as that known as "Criollo," to as much as that of the more commonly productive varieties.

It will also be possible to maintain perfectly true any kind which may have arisen from seed, on any plantation, and to preserve indefi nitely any particular kind that may be desired. We have yet to prove, however, how the grafted plants will thrive, but judging from grafted plants of other kinds, I see no reason to anticipate that there will be any difficulty under this head. I recommend the practice as well worth the attention of planters who have on their estates single trees which are noted for the quality of the bean and the quality they produce.

CACAO DISEASE.

I have been requested by a successful and prominent planter to bring up before The Society the question of disease among Cacao trees in Trinidad for discussion. This gentleman has forwarded to me several specimens of (so called) diseased Cacao, but after a careful and lengthy microscopical examination, I have not been able to say that the pods have been destroyed by disease. I am free to confess, however, that there is possibility of disease arising in any culture, and therefore in Cacao ; but I must reprehend as strongly as possible the spreading of views that we have disease of certain kinds until it has been fully proved that such do exist, as it is calculated to do an immense amount of harm to the Cacao Industry. A strict watch-however, should be kept for anything which appears to be of a peri, nicious character, and planters would, I think, do well to forward affected specimens to me, to be transmitted to mycological authorties, if necessary. So far, I may say, I have not found anything of a pernicious charactor and I should be glad to hear my idea confirmed, that at present there is little cause for alarm.

PRODUCE AND PLANTING.

The Tea Duty Question.

We announced last week that the joint committee of the Indian and Ceylon Tea Associations had decided against any agitation for the abolition or reduction of the tea duty. This duty they opine bears more heavily on China tea than the British-grown product, and that it is better to leave things as they are. A representative committee, such as that whose decision we refer to, may be supposed to know what is best for the interests of tea-growers in India and Ceylon, and their verdict may be accepted in that light. So far as the political aspect of the tea duty is concerned, however, we do not imagine the views of the Association will count for much. If the consumer is content, the Chancellor of the Exchequer, we may be sure, will not thrust any change upon the country. But certain politicians who are advocates of a "free breakfast table" programme consider the abolition of the tea duty an item to conjure with when before their constituents, and if they can gain additional popularity from their supporters by a show of enthusiasm on the subject, the Chancellor of the Exchequer may be induced to agree with them. The voice of the consumer in this matter, if it were to make itself heard, is likely to prove a more potent influence than even the resolutions of Tea Associations, although at the present moment an opinion from a body of experts against any change in the duty may be very acceptable to the Chancellor of the Exchequer.

Last Week's Tea Sales.

Notwithstanding the continued liberal supply, the market for Indian teas generally shows a decidedly firmer tendency, says the *Produce Markets Review*. The increased strength in the statistical position is largely accountable for this, the deliveries for the past month, as will be seen by the following figures, being the largest on record. Although teas cannot be bought on quite such favourable terms as a week or two since, the advance is in no case sufficient to check the demand, as values continue sufficiently low to have a stimulating effect on the consumption. No important increase on the latest estimated quantities is anticipated, and as regards future prices it would appear safe to conclude that any movement will be upwards rather than downwards. The decrease in the stocks of other kinds of tea, particularly as regards the lower grades, will in a great measure throw the demand on Indian so long as the present range of values last, and it is quite possible that the deliveries will continue to show an increase on those of last year. Should, therefore, the imports reach the estimated quantity available for this market, the supply is not likely to exceed the requirements of the trade. On the other hand, there is still a considerable portion of the crop to come forward which will amply supply the market for some time to come, and this will tend to keep prices in check. For the past month the following are the figures compared with October last year :— Imports were 22,072,000 lb. and 19,880,000 lb. respectively, while the deliveries reach the heavy total of 13,185,000 lb. against 11,533,000 lb., but the stock is slightly smaller, a most unusual occurrence at this period of the season. Taking the deliveries for the five months, viz., from June 1 to the end of October, the increase is very pronounced, being no less than 6,741,000 lb. There has been no quotable change in the Ceylon tea market, the demand continuing good for all descriptions under about 10*d.* per lb., and previous values were well maintained.

The common grades of whole leaf tea were again much sought after, and realised fully last week's rates, while an occasional advance was noticeable. For the better qualities over 11*d.* and upwards the demand has been somewhat slower, and as buyers were not anxious to increase their stocks of these descriptions, irregular and sometimes lower prices resulted. At the public sales 24,690 packages were offered, of which about 1,900 were withdrawn. The following are the figures for the past month as compared with October last year :— The imports amounted to 6,950,000 lb. against 5,520,000 lb. and the deliveries were 8,431,000 lb. and 8,517,000 lb., respectively, while the stock stands at 18,222,000 lb. with 19,648,000 lb.—*Home and Colonial Mail.*

CEYLON TEA IN AMERICA.

A Letter from Mr. Wm. Mackenzie, Ceylon's Tea Commissioner in the United States, gives a sketch of the tea trade in America and Canada. As regards Boston he writes :—

One of our friends there said the business was "dead" ; another firm, that has spent much money advertising our teas during the last year, were going "out of the business," at once, and so on and so on. He then proceeds :—As regards the consumer, there is no doubt that with coffee so very cheap, he does not drink as much tea at 40 cts. as he did before the duty went on, when he could get it for 30 cts. But the very great decrease in the shipments of all teas to America so far this year,—a drop of one-third, from 52 millions to 35 millions to end of September is not due entirely to the falling off in consumption. Dealers are living from hand to mouth on old stocks, which

were in before imposition of duty. The stocks must be very low, and when replenishing begins, the imports should be large. Meantime, grocers are afraid to buy in case the duty should be suddenly taken off, and they be left with stocks on hand on which the duty had been paid.

In Canada, matters are very different. There is nothing so much advertised there as Ceylon tea. Not only are the papers full of it, but walls of houses and boardings on empty spaces in the towns are covered with large placards, while many grocers' shops have two and three signs in large white enamelled letters on their windows, "Sale in Ceylon Tea," "Monsoon," "Kotonna," "Blue Ribbon," "Tetleys," etc., etc. I came across four new packages the "Ceyloya," "Ceylon Tea," the "Rakwana," etc., etc. In Montreal, a large van was being drawn by four horses at a rattling pace through the streets, from the top of which men were throwing samples on to the pavement. This was a new brand, the "Anglo-Saxon."

All this advertising is very costly, and in somes cases is done at the expense of the quantity of the tea. I have learnt since coming over of two orders for 1,000 chests each, one for Calcutta, and one for Colombo, of tea to be delivered here at a fraction over 5*d*. The one for Calcutta is from a firm advertising Ceylon tea only, and boasting of their fine cup quality!

It is a matter for congratulation that, whereas the total imports of teas to the States, and Canada, show such an immense falling off, Ceylon teas are an exception. The shipments from Colombo direct, and *viâ* China, are two and-a-half times as much as last year, while up to end of September, shipments from London were slightly in excess of last year.

Were there a duty on tea in Canada, it is probable there would be discrimination in favour of British-grown teas. But as there is no duty, one will not be imposed on foreign teas to favour us. It is at present generally believed in Canada that a duty will be imposed next year, in which case it may be somewhat lower for our teas than for Japan or China teas. Several Canadian tea dealers expressed the opinion very strongly that Ceylons were rapidly ousting Japan teas in Canada. On the other hand a leading Japan dealer told me he never sold his imports so easily in Canada as this year. On quoting this statement of his to the former gentleman, they said "Very likely, because he never had so few to sell," exports from Japan having fallen off so much this year. Be this as it may, there is no doubt that although the Japanese are increasing their advertising in Canada, there is ten times as much noise made in that way by the offensive and aggressive Ceylon and India package people, as by the old dealers in China and Japan teas, who are the defensive party. I believe the special work we are now beginning in Canada will greatly aid our friends.

What Congress will do with regard to taking off the duty in the States or putting a similar duty on coffee, it is as yet impossible to say. Coffee is grown largely in some of America's new possessions, especially Porto Rico. A duty may be put on Brazil coffee to protect the newly acquired Colonies. In one of this morning's New York papers, it is stated that the cost of the war has been only about one-seventh of the 800,000,000 dols. appropriated for it. If so, the war duties may be withdrawn, unless, as is quite possible, every man who was enrolled for service and all his relatives be put on the pension list. So far this year, 17,000 new pensioners of the war which ended in 1864 have been put on the list. Pensions for that war have been doubling every three or four years since the ended, and now amount to £33,000,000 (not dollars) a year. men met on the street a few days ago. One said, "Glad war is business will be good now." "What is your business?" asked other. "Pension Attorney."

Mr. Mackenzie states that Ceylon Tea is being advertise 48 papers in the States.

TEA COMPANIES.

Lanka Plantations.—The directors, in their report for the tw months ended June 30 last, state that the coffee crop shippe London was 247 cwt., against 572 cwt. last year, and real £1,072 11*s*. 8*d*. net. The acreage under coffee alone is nomin 164 acres. The total crop of cocoa gathered on Yattawatte amou to 1,509 cwt., against 1,272 cwt. last year, and realised £4,806. I ing the season 34 acres were planted with cocoa and 18 acres of avail land adjoining the estate have been purchased, making a total of acres new land. The cost of the land and the new planting charged to capital account. On the same estate 2,125 lb. cardam were gathered, realising £269. The tea received from the compa estates amounted to 731,593 lb., and has been sold at an averag 7·45*d*. per pound net, realising £22,840. Last year the comp received 701,112 lb., which was sold at an average of 7·53*d*. per po net, and realised £22,002. The cost of production has been increa by a further rise in the sterling value of the rupee. The aver rate at which drafts were negotiated on account of the season's cr was 1*s*. $4\frac{3}{32}$*d*. per rupee, against 1*s*. 3*d*. last year, this further representing a loss of about 1 per cent. on the ordinary share cap of the company. The net profits for the past year amounted £6,149, to which must be added the sum of £495, the balance brou forward from the year 1896-97, making together £6,645. Hav already paid a half-year's interim dividend on the six per cent. ference shares to December 31, 1897, amounting, less property tax £426, the directors recommend payment of the dividend on th shares to June 30 last, requiring, less property tax, a similar amou and, having deducted £1,398, being one-tenth of the sums charge suspense account during the ten years ended June 30, 1897, t further recommend a dividend of 5*s*. per share, being $2\frac{1}{2}$ per c free of income-tax, on the ordinary shares, amounting to £3, carrying forward a balance of £644 to the next account.

Ceylon Land and Produce.—The report of the directors for crop year ended June 30 last states that the amount at credi profit and loss account is £10,022, which, with the sum of £ brought forward from last year, leaves £10,778 to be distributed. July 1 last an interim dividend of $7\frac{1}{2}$ per cent. on the ordinary sha and 3 per cent. on the preference shares was paid, and the direct now propose to pay on December 15, 1898, the balance of the fi cumulative dividend on the preference shares (3 per cent.) and $7\frac{1}{2}$ cent. on the ordinary shares, making 15 per cent. for the year, a in addition, a bonus of 5 per cent. on the ordinary shares, all free income-tax. It is also proposed to transfer £3,000 from profit a loss account to reserve fund, and carry forward the balance of £1,2 subject to the directors' remuneration for the year. The crop tea slightly exceeded the estimates framed at the commencemen the company's financial year, and but for the drought experien during March, April, and May last, the intake would have been m larger. The cocoa estimates were secured, though the practi failure of the spring crop must be recorded. The net prices obtai for tea were again lower than those realised for the previous cr due partly to lower markets in London and Colombo and partly the rise in freights. The directors hope that the current ye estimate of tea will be realised, though at the moment the intak somewhat less than at the same period last year, owing to a rec rence of the drought; however, latest reports advise more favoura weather.

Doom Dooma Tea.—The directors have resolved to declare ad interim dividend at the rate of 5 per cent., free of income-tax, account of the 1898 season. The tea crop of this season to 31st amounted to 1,842,160 lb., as compared with 1,698,480 lb. to Oct. last year. The sales (up to and including that of the 3 ultimo) of 1,014,800 lb. in London have averaged $11\frac{17}{32}$*d*. per pou as compared with the average to same date last year of 926,640 at 1*s*. $0\frac{1}{32}$*d*. per pound, or with the total 1897 average of $11\frac{13}{32}$*d*. pound.

Clunes Estate Company, Limited.—An extraordinary meeting of the Clunes Estate Company, Limited, was held at the offices of Messrs. Whittall & Co., the agents and secretaries at Colombo, on 26th ult. It was resolved "That the directors be authorised to borrow a sum not exceeding R50,000," and—That a dividend of 8 per cent. for the year ending 30th June, 1898, be declared, payable on the completion of the negociations for the loan sanctioned by the shareholders. The Chairman said the directors hoped to pay the dividend by December 15th, by which time it was thought the loan would be completed.

Hornsey Tea Estate Company, Limited.—The total crop has been 146,226 lb., against last year's crop of 150,967 lb. The average sale price in London has been 8·95 per lb., against 8·72 per lb. last year, and 35 cents for tea sold in Colombo, against 32½ cents. The average rate of exchange is 1*s.* 4—3-32*d.*, against last year 1*s.* 2—29-32*d.* The cost of production has been 36 cents per lb., or at exchange 1*s.* 4 3-32*d.*, equals 5½*d.* f.o.b. Colombo, against 5*d.* per lb. last year. Prospects are more encouraging for the ensuing year. The crop from 1st of July to 20th September is 11,757 lb. made tea ahead of the corresponding period last year, and prices are satisfactory. The Directors after paying Mortgage Interest and Preference Dividend for the year carry forward £126 3*s.* 2*d.* to the debit of profit and loss account.

PLANTING IN TRAVANCORE.

COMMENTING on recent remarks of the British Resident, the *Western Star* says:—

Noting that the monopoly system affecting cardamom gardens has given place to a system of land tax, the Resident is disposed to believe that the change has worked satisfactorily; for, says he, "after enquiry on the spot and after visiting most of the gardens, "I think myself it will prove successful." Cultivation is on the increase and a large number of applications for land have been put in already, chiefly by Europeans. "The native coffee cultivator," observes Mr. Rees, "is—not without some reason, it must be con- "fessed—looked on with extreme disfavour by his European "neighbour with his far larger estate, but this is an indigenous "and native industry; and the cardamom cultivators, who have "hitherto been clients of the Sarkar, will not, I hope, be crowded "out by the grant of all the land to neighbouring tea and coffee "planters. As for granting lands for homesteads, which is also "contemplated, the place is too feverish even for native cultivators "to inhabit. They only come up from Madura side for the cropping. "The dread they have of the fever, which in fact is most malignant, "and the extreme improbability of any proprietor settling there are "hardly appreciated at Trivandrum." But drawbacks like these have been overcome by European capitalists before now; and we have a notable instance in point in the case of the Shevaroy Hills, which, from having been once similarly dreaded and avoided by the Natives for like reasons, have now been converted into flourishing plantations and a health resort into the bargain. Those who may like to read how this remarkable transformation came about will find much to interest them in Mr. LeFanu's "Manual of the Salem District." By the way, our Planter readers, in search of fresh fields for tea and coffee cultivation, might do worse than make a note of what that writer records about the Yellagiri Hills, situated in the immediate vicinity of the railway junction at Jollarpet. *Revenons à nos moutons*, Mr. Rees notes that Devikolam *has* already become a great centre of planting activity, possessing a large population which is served by telegraphs and telephones,—the capital of the chief company carrying on operations, there being no less than £1,000,000, while there are other important companies and large private proprietors. As the Resident observes, there can be no gainsaying the assertion that these operations have an important bearing on the future of this State, though "their magnitude is as yet imperfectly "appreciated" by the local Government.

Here it will be of interest to turn to what Mr. Rees has to urge as to the requirements of Planters in the direction of road communications and other Public Works. Admitting the oft-urged need for a cart-road to connect the High Ranges with the low country, the Resident adverts to the fact that this road has been considered indispensable by the Travancore Government itself for administrative purposes; and it is noted also that "the North Travancore Land "Planting and Agricultural Society has urged with much force the "wants of this isolated Hill Range from the Planter's point of view "—the difficulty of supplying coolies with food, and the manner in "which its extensive operations are handicapped for want of a "communication with the west." Admitting and noting all this, Mr. Rees adds:—

I entirely agree with the late Dewan, with the late Resident, Mr. Grigg, who like myself knew the district, and with His Highness the Maharajah's Government in thinking this a most important requirement. Indeed, it seems to be much more needed than any other work which the Durbar has in hand, or under consideration, excepting only the Railway. It is remarked in the report that the "furtherance of the scheme belongs to the current year" (1073 M.E.). But writing at the eastern end in May, 1898, and after a recent inspection, I cannot say that progress has been at all rapid since I first went over the trace in 1896. Indeed, I fear that no serious work will be commenced before the June rains fall, and that the High Range will continue for another year to be practically more Madura than Travancore. It is true that a bridle-path has been opened since 1896, but for the cart-road not even an estimate has yet been prepared. The North Travancore Land Planting Association has, with extraordinary rapidity, cut a road from Moonaar to the head of the Kottgudi Ghaut, a distance of about 16 miles, whence a wire ropeway will shortly run to a spot on the plains within a few miles of Bodinayakkanur, thus further connecting the High Range with Madura rather than with Travancore. That this outlet should also be constructed cannot, at any rate to a servant of the British Government, be matter for other than congratulation, but it is somewhat astonishing that the Durbar should willingly see prolonged, even for a season, that isolation of this district by which, economic and administrative reasons apart, it has in the past been so much prejudiced. Now that there is a good prospect of the construction of a railway to Cochin within the near future, the need for action becomes more urgent, that port being within sight from many points in the district though distant by several days' journey. Yet this is already the largest tea district in South India, upwards of 12,000 acres being opened (chiefly under tea) against 5,000 in Peermaad. It is also probably the largest compact planting district, for North Mysore has about 12,000 scattered estates under coffee and Coorg 8,500 acres. The Nilgiri figures are not available.

All this should be congenial reading to our Planter friends, and vastly edifying to the Durbur authorities here; but Mr. Rees seems to have got heated over his theme and does not feel justified in dropping it at this point; for he presses the matter still more forcibly, thus:—

The last notes on business written by the late Mr. Grigg were upon the urgent need for a cart-road to the High Range from the west, and the exposure he underwent, travelling over the ground, is considered to have contributed in no small degree in the illness of which, very shortly after his return, he died. An extract from the late Dewan's letter to the Resident on the subject in 1895 is appended to this report.

This excerpt, as given in an appendix to the review before us, runs thus:—

The question discussed for Mr. Jacob [Chief Engineer] as between the eastern and western lines of communication is a very important one, and demands mature consideration. The high range is now shut out from all access on the Travancore side. As it grows in importance and interest, a through communication with the low country will have to be provided sooner or later for administrative purposes at least, if for nothing else. Otherwise, tract will remain isolated, and Government will have no small difficulty in coping with its administrative needs. No doubt the construction of a cart-road from Travancore low country to the high range will be attended with more than ordinary difficulties. The cost, too, must be abnormally heavy . . . . The difficulties and cost are not to be measured by the present advantages alone, but by those for all time to come. Future generations will forget the cost, but will enjoy the benefit in an ever-increasing degree as in the case of the Vurkalay tunnel, and the ghat roads to Peermaad, Aneikavan, Ponmudi, Muttukuli and Ashamboo. Mr. Jacob has failed to considered this aspect of the question.

Commenting on this document further, Mr. Rees observes that the district in question has advanced by leaps and bounds since Dewan Shungarasoobier penned these lines—activity in land buying and jobbing having proportionately increased, while administrative necessities have likewise developed immensely—"with an "expenditure of lakhs every month on cooly hire and communications "by the North Travancore Land Planting Association and other "companies and planters." The forcefulness of this welcome advocacy of the Planters' cause is pointedly accentuated by the Resident's concluding reminder, that the European population of the High Range now numbers upwards of 100, while the native population, excluding that of hill villages, may already be reckoned at about 10,000. Here we see our British Resident pulling strong in the right direction—with his head held just the proper way.

INDIAN TEA ASSOCIATION.

TEA AND STERLING PRICES.

A MEETING of the General Committee of this Association was held on November 7, Mr. G. G. Anderson in the chair. There were also present Mr. H. S. Ashton, Mr. A. C. Lawrie, Mr. M. R. Quin, Mr. T. Traill, and Mr. W. Warrington.

The following are extracts from the proceedings:—

It was reported the London Association had under consideration the subject of a proposal for the reduction of the present dnty on tea, as it was thought that the increase of consumption, on such a step being taken, might have the effect of supporting the prices in London.

The London Committee had before them the resolution of the United Planters' Association of Southern India in favour of a reduction being made, and a Sub-Committee had been formed, consisting of Messrs. W. H. Verner, A. Bryan, and C. C. McLeod, to meet the representatives of the Ceylon Association, with a view to discuss the measures to be taken in endeavouring to obtain a reduction on the duty. It appeared that dealers and brokers in the Lane were generally against the total abolition of the duty, but considered that the consumption of all classes of tea would be increased if a reduction in the duty were made.

The Committee had also considered the question of endeavouring to secure the enforcement of a compulsory cess on tea, but were informed that a considerable section of the Indian tea industry were not in favour of this proposal; and until unanimity could be secured, it would be impossible to obtain Government co-operation.

Also the Committee forwarded a copy of the *Financial Times* in which was a leading article on the subject of new markets. The writer mentioned that to anyone visiting America it must be apparent that there is a promising field for the working up and disposal of tea among the agricultural classes, especially in the North American continents, where tea is regularly drunk at every meal. Until recently green teas of China and Japan have been the favourite leaf, but during the last year or so experience had shown that the North American does not confine himself entirely to the Chinese product, and further efforts to introduce British-grown teas could scarcely fail to increase their consumption.

The London Secretary reported that the exports of British-grown tea into foreign markets continued satisfactory, the figures just published for the nine months from the 1st of January to the 30th of September showing that 5 million lbs. of Indian tea had been taken against $3\frac{3}{4}$ millions and $2\frac{1}{2}$ millions for the same period in 1897 and 1896. Of Ceylon tea $8\frac{3}{4}$ millions lbs. had been exported in the nine months, an increase of one million lbs. over 1897 and 3 million over 1896, while the export of China tea had dropped 2 million lbs. since the latter year. The home consumption was also most satisfactory, $96\frac{1}{4}$ million lbs having been taken in the nine months against 92 millions in 1897 and 88 millions in 1896; both Ceylon and China leaf showing decreases of 2 million lbs., as compared with last year for the same period. The total consumption of the country remained the same as last year, viz., $173\frac{1}{2}$ million lbs. The Secretary reported that the amount of contributions promised to the American Market Fund was Rs.95,852-1-6.

Recorded letter of 20th October from the Secretary, Bengal Chamber of Commerce, in reply to a letter dated 14th October from the General Committee, in which they expressed their regret that steps should have been taken, and Government addressed suggesting that an official should be deputed to proceed to China to make enquiries on the spot regarding the effect of the fall in the value of silver on production and prices, and on the effect this might be expected to have on exports to China, without the representation of the tea industry being given an opportunity of expressing their opinion on the subject, and also suggesting that in the event of sanction being accorded to this proposal, a gentleman of Commercial experience should be associated with the Government official in his mission. The Committee of the Chamber replied that when they took the matter into consideration it had not occurred to them that there could be any opposition to an enquiry being made into the condition of trade and currency in China in view of the meagre amount of reliable information available, as disclosed by the evidence before the Indian Currency Committee in London.

Considered letter, dated 30th Sept., from Mr. J. Buckingham, C.I.E., the Chairman of the Assam Branch, handing a sample of green tea which he had just made, and four cases of which he had despatched to London to be reported upon. The Secretary had been instructed to obtain a report from two firms of tea brokers this sample. Reports had been received from Messrs. Baines Co. and J. Thomas and Co. The Secretary was instructed to s copies of the brokers' reports to Mr. Buckingham, and also co to the London Secretary for despatch to Mr. Blechynden, and asked to inform the London Secretary that samples of green which were in demand in America had not yet reached Calcu though it was understood Mr. Blechynden would send some.

Considered letter from Mr. W. T. Carter, enclosing copy letter addressed by him to the *Englishman* on the subject of " and present low Sterling Prices." Mr. Carter suggested that merchants of India and Ceylon should combine to supply the re portion of the trade according to its requirements by placing on certain quantity of tea on the market every week throughout twelve months, so as to equalize to some extent offerings at auct and consumption month by month.

In support of this opinion Mr. Carter supplied figures compar the amounts of tea offered in London and consumed during the y 1896:—

	Offered in London. lbs.	Consumption lbs.
January ...	... 20,894,600	18,570,000
February ...	... 22,416,000	16,700,000
March ...	... 13,250,800	16,680,000
April ...	... 12,707,600	16,844,893
May ...	... 14,913,200	16,500,000
June ...	... 13,445,400	15,900,000
July ...	... 16,235,400	16,400,000
August ...	... 14,408,400	16,200,000
September ...	... 23,489,300	17,802,602
October ...	... 33,612,500	20,103,753
November ...	... 28,069,300	19,684,000
December ...	... 16,049,600	18,575,153

The Secretary was instructed to send a copy of Mr. Carter's le and figures to the London Secretary with the view to an express of opinion by his Committee as to whether any action in the ma could be taken.

Recorded letter from the Director-General of the Post Offic India, in reply to a letter of the 20th October, enquiring whet Government would be disposed to sanction arrangements for Ind tea being sold by Postmasters throughout the country, as is d in the case of the cinchona febrifuge. The Director-General sta that the proposal could not be entertained. Whatever might be merit of tea as a "useful and beneficial beverage" for the publi could not be placed in the same category as a medicine like quin and it would be impossible for a Government Department like Post Office to undertake a service of this kind on behalf of a priv Association. The Secretary was instructed to send copies of correspondence to the Secretary to the London Association. It suggested that the Indian Tea Supply Co. should be approache ascertain if they would undertake the disposal of tea dust if it w consigned to them free, in order to introduce the taste for among the poorer class of natives, and the Secretary was instruc to write to the agents of the Company to this effect.

NEW FRUIT TREE.

A NEW fruit tree is described by Andree in the *Revue Hort* The name of the plant is *Feijoa sellowiana*. It is indigenous i Plata, South America, but also thrives in Southern France. tree which blossomed and bore fruit in Andree's garden attain height of $3\frac{1}{2}$ metres, and had the form of a shrub. The fruit i oblong, egg-shaped berry, four to six centimetres long and thre five centimetres wide, retaining its colour even in the ripest co tion. The meat of the fruit is firm, of white colour and sweet t containing much juice, and giving off an extremely agreeable penetrating odour. The flavour is said to remind one of the apple.—*Public Opinion.*

NOVEL METHOD OF KILLING PLANT PESTS.

MR. H. E. SAMPSON, of Portland, in a letter to the Melbo *Leader*, states that he "treated certain diseased apple trees by bo a hole in the trunk, filling it with sulphur, and then stopping w plug. The trunk is only two inches in diameter, and the hole made with a three-quarter auger, which was worked until the came out at the opposite side. Until so treated the trees

infested with apple spot, woolly aphis and other pests, but are now free from disease. So bad were the trees at one time that some neighbours advised that they should be destroyed. During the 1897 season nine cases of saleable apples were gathered, and this year, in spite of adverse conditions, six cases were obtained. I desire," Mr. Sampson concludes, "to make these facts known for the benefit of all whom it may concern."

PLANTS AND ACETYLENE GAS.

A FEW days ago there was a "private view" at the Botanical Gardens, Edgbaston, of the installation of acetylene gas, which had been introduced into the houses; in the first place for the purpose of a garden party given to the United Kingdom Band of Hope Conference, and also at the close of the garden party given by the Health Committee to the Sanitary Institute Congress. There was a large attendance of members of the Botanical and Horticultural Society and others, and the various demonstrations and explanations which were given were listened to with much interest. In the course of the evening the Honorary Secretary of the Gardens, Professor Hillhouse, took the opportunity of saying that in the interests of the Society he had studied the light from two points of view—injury to plants from evolved gases, and relations with colour. He had gone through the houses with the utmost care, and had failed to see the smallest sign of any of those injurious effects which the combustion of coal gas had upon plants, and in this conclusion the veteran Curator of the Gardens, Mr. Latham, entirely agreed. The second point for inquiry received an equally satisfactory answer. The most critical colours, so far as artificial illuminants were concerned, come out of the ordeal with success. The mixed shades of mauve and magenta, such as those of Bougainvillea, were at least as perfectly displayed as with the arc light, while the various shades of yellow, from pale to deepest chrome, which were possessed by such a flower as the Allamanda, could hardly be more distinguishable in ordinary sunlight.—*Journal of Horticulture.*

CEYLON TEA IN AUSTRIA AND HUNGARY.

THE following are excerpts from a report by Mr. James Ryan to the "Thirty Committee," Kandy :—

VIENNA.

I arrived in Vienna on July 1st, 1898, and was met by Mr. Marinitsch, to whose intimate knowledge of that city and linguistic ability I am much indebted. Through his help I was able to do my work in Vienna and Budapesth at a considerable saving of time aud money.

HOW TEA IS SOLD IN VIENNA.

The Vienna tea shops are fairly numerous and are of the best class of shops gauged by a local standard. I was surprised to find tea in such general use as to make it in many instances the principal article sold, although as a rule coffee, spices and Japanese curiosities were sold in the same shops.

I visited a large number of these tea shops and purchased samples of teas, which I forwarded to the Secretary of the Ceylon Association in London for valuation and report. Messrs. George White & Co. examined these teas, but found them so out of condition that anything like a minute valuation was impossible. They report, however, that some of the teas had originally been of very fair quality. This might very well be the case, as the teas ranged as a rule from eight shillings per lb., one sample being retailed at about one sovereign English per lb.

In all instances China tea was recommended as the best. Ceylon tea was as a rule known by name, but was generally depreciated.

In one or two of the shops, however, Ceylon tea was procurable unmixed, and we saw it in the original packages—(half chest)—I noticed particularly the names of Abbotsleigh (pronounced in Vienna "Albertslake") and St. Johns. These teas were Orange Pekoes, wiry tippy and clean of dust.

MEMORANDUM *re* TEAS WANTED IN VIENNA.

It appears that only leafy teas—(absolutely free from dust and small broken and flat leaf)—have any chance in this market. The merchants tell me that their London constituents do not supply them with teas suitable to their requirements in this particular, but that Hamburg vendors do manage to do so. Complaints to London of dustiness are met with the reply that such a percentage of dust cannot be avoided. If this is actually the case, the cause may be due to the tea being broken in the repacking necessitated by the London Warehouse regulations, as my experience in Ceylon leads me to think that most factories sufficiently comply with the requirements of the Vienna merchants taking the teas as they leave the estate.

What struck me, however, was that, so long as teas were free from dust, the twist was not greatly looked to and wiriness was not directly recognised as a desirable quality. The most expensive, the "Caravan" and "Kaiser Melange" types (ranging from 12 to 20 shillings per lb.), contained a large percentage of leaf which was hardly rolled or fermented at all, very large and bold and of a Souchong type. Broken, flat leaf, however large, did not appear to be disliked, so long as it was free from dust and small broken leaf.

The tip when present was prominent, bold and silvery (not golden) in colour in these (China) teas. Dust then appears to be objected to mainly as a suspected impurity, and possibly as productive of too dark and pungent a liquor.

PRICE OF TEAS.

Even making allowance for a duty of nearly 10*d.* per lb. and the expenses of carriage *viâ* London and Hamburg or overland *viâ* Russia, the price of teas in general use in Austria is prohibitive of a daily consumption in an ordinary household. The teas are really good teas, but sold at an exorbitant rate, and it will be a hard fight to induce the trade to forego their present enormous profits.

Still there is a wonderfully large consumption of tea under the circumstances, and the demand appears to be on the increase, especially on the Galician frontier, where Russian influence is very marked, and this demand might be increased by the following means :—

1*st.*—A reduction of duty.
2*nd.*—Competition between dealers reducing prices.
3*rd.*—The spread of the knowledge of the fact that a good tea can be got at about a quarter of the present price.

I may add that I am opposed to the free distribution of tea, although I, at one time, believed strongly in it. I am now of opinion that a large proportion of tea distributed free is never consumed at all, but allowed to lie forgotten until it is spoiled, and unless tea, when drunk for the first time, is made by some one who knows how to properly infuse it, it stands a good chance of being actively disliked, and the advertisement works against instead of in favour of Ceylon.

Besides this there is the tendency a man always has to undervalue a thing he has got for nothing, whereas he values exceedingly what he has had to pay for, although he may have paid dearly for a bad article.

PROSPECTS OF TEA.

I am everywhere informed that the use of tea (even at the present prohibitive rates) is on the increase, and I have no doubt that a carefully conducted campaign will be productive of a further increase of consumption.

I cannot too strongly, however, express my opinion that we must have a reliable representative on the spot for some few weeks at least every year.

ADVERTISING.

Mr. Marinitsch has formulated a scheme for advertising Ceylon Tea by Posters and also by advertisements in the Press. It would be noticed that the cost of advertising is comparatively cheap.

GENERAL OPINION OF ADVERTISING.

Indiscriminate advertising must be avoided. In Austria, the populace is not an advertisement-reading one to the same extent as Germans are, and advertising generally is much less prominent, while comparatively few people advertise. On the other hand the small number of press advertisements secures greater attention being paid to such goods as are advertised.

HOTELS AND RESTAURANTS.

The only form of free distribution of tea that I would countenance would be that certain first-class hotels and restaurants should get a grant of tea (say 500 lb. weight), one half to be infused in cup and sold to customers and the remainder to be sold in packet—the whole profit to go to the vendor. There are several good shops in Vienna where the fashionable world goes to drink coffee and tea, and eat ices and confectionery of an afternoon, and one of these might be induced in the above manner to make a specialité, once or twice a week in the season, of Ceylon tea.

The others would be forced to follow suit if the thing became fashionable.

TEA FOR THE AUSTRIAN TROOPS.

Owing to the courtesy and help of His Excellency Sir Horace Rumbold, and Col. Wardrop, I was able to see certain members of the Imperial General Staff. In conversation, their attention was drawn to the military aspects of the late British Campaigns conducted on teetotal principles, and it was suggested that anything in the nature of an experiment as to the value of tea in Army Manœuvres would receive the co-operation of the Ceylon Planters who would guarantee that a reliable sample of tea would be supplied for purposes of experiment. The incidence of cost was not directly mentioned, but it was made clear that the planters were not acting as retail vendors, but as producers of tea, wishing, politico-economically, to extend their area of operations.

In reply we were informed that :—(1) No ration of tea was issued in the Austrian army; (2) that the Atbara and Chitral Campaigns had received appreciative attention; (3) that no compulsion was at present used to make the soldiers drink anything non-alcoholic to the exclusion of alcohol; (4) that the soldier could buy as much beer, wine, etc., as he liked in canteen (there is practically no drunkenness in the Austrian Army); (5) that if I could supply the General Staff with further detailed information as to the value of tea for forced work, that my communication would receive attention.

I suggest then that the matter be treated as follows :—

That a Sub-Committee be appointed to draft a treatise on the dietetic value of tea. An analyst would be the best man to procure for the scientific portion of the work, and a little co-operation from practical planters would be sufficient to give the work a permanent value. The pamphlet could be printed for permanent use in the extension of the use of Ceylon tea in Europe and America.

This pamphlet should be freely circulated among the medical press, and any favourable criticisms appended to later editions.

Your Continental Agent could personally approach professors of Medical Science in Austria and Germany on this point. Much attention is paid by the public to their pronouncements, and many of these gentlemen are already predisposed in favour of Ceylon tea.

CONCLUSION.

It must be noted that my report is to a certain extent barren of practical result, as I was not empowered to make any specific promise of assistance to certain persons who are willing to consider the question of dealing in Ceylon tea only, and this indefinite state of affairs must continue until your Committee have a discriminating representative on the spot.

A distinct offer to pay for advertising would bring forward, not one, but many firms of repute willing to give prominence to Ceylon tea.

CEYLON TEA IN HUNGARY.

The remarks made as to tea in Vienna practically cover the question of tea in Hungary. The Hungarians are a less conservative and more pushing people than the Austrians, and (although at present consumers of but a small quantity of tea) show signs of taking an increased amount in the near future.

TEA IN GERMANY.

In my passage through Dresden, Berlin and Bremen, I was able to note the large strides that are being made in the consumption of tea in Germany. I particularly noticed the efforts of Mr. Hagenbeck to push your staple in Berlin. He has expended a large amount of capital in the possible way, and I have no doubt will be successful in introducing tea to thousands of persons who otherwise would not have heard of it.

EXPORT DUTIES AND OPEN MINTS.

"X." writes in *Capital* :—

I wish I could think that a sliding scale of export duties, as proposed by Mr. Robert Gompertz and advocated by "Producer" in *Capital* of the 10th instant, would solve India's distracting currency problem; but unfortunately there are certain economic considerations in connection with the proposal which would seem, if carefully examined, to show that not even a sliding scale will bring us salvation.

To describe the suggestion of Mr. Gompertz as "the only suggestion that can be taken at all seriously" may sound a very comforting phrase, but "Producer" has apparently only looked at one side of the shield. For the course proposed by the Shevaroys planter unfortunately within it certain grave defects, which sooner or l would make themselves manifest. I have the full report of Gompertz' speech before me as I write, and to make myself cle will take the liberty of quoting from it as occasion may arise. speaker *inter alia* observed that the loss to Government, if the ru fell to 11*d.*, was estimated at 15 crores, but as part of this loss already covered by taxation, it was only necessary to consider the balance should be met. Producers, he continued, were q willing to have an export duty placed on their produce, provi that, if the rupee rose in value, or the export trade increased, duty should be proportionately reduced. Mr. Gompertz went o say that if Government would do this, they would be prepare bear their share of the burden by accepting an export duty of 2 cent. for every penny that exchange might fall below 1*s.* 4*d.* If proposal was adopted,—taking produce worth £100 in each case facility of comparison,—the producer would get the follow accounts :—

Exchange.			Export Duty.	Result.
s.	*d.*	Rs.		Rs.
1	4	=1,500	... Nil	... 1,500
1	3	=1,600	... 2%	... 1,568
1	2	=1,714	... 4%	... 1,645
1	1	=1,846	... 6%	... 1,735
1	0	=2,000	... 8%	.. 1,840
0	11	=2,182	... 10%	... 1,964
0	10	=2,400	... 12%	... 2,112

From the above, said Mr. Gompertz, it would be seen that if rupee fell to 10*d.*, which seemed quite possible, they would, af paying the export duty proposed, get Rs.2,112 instead of Rs.1,5 for every Rs.100 worth of produce. The lower the rupee fell, greater would be the loss to Government, the greater their taxati and the greater their gain!!

It may be worth while just noting here that this scheme rea originated with Mr. G. L. Acworth, who was chosen by the Sou Indian Planters as their representative before the Currency Co mittee; though, as Mr. Gompertz has prominently identif himself with the scheme *in loco parentis*,—no doubt because Acworth was at home,—I will continue to allude to it as the form gentleman's offspring in this article. In another part of his spee Mr. Gompertz said "the purchasing value (power I suppose) of t rupee has not materially decreased with the fall in the value of t rupee." He was here, as I understand it, contending that lo prices have risen very little for the labourer, &c., and that, howe much they may have risen, their rise has not been the result entir of the fall in the value of silver. My own opinion, as I have ende oured to show in *Capital*, is that prices of indigenous food stu have risen very materially in several parts of India, in the ma owing to quite other causes than the depreciation of silver, nor d think that the closure of the mints, so far anyhow as can be prov has made food stuffs appreciably dearer. This by the way howev

Now to come to the main argument. It may, I suppose, assumed, from the sliding scale quoted, that if exchange be 1*s.* 4*d.*, and the producer sells £100 worth of produce for which receives in India Rs.1,500, that he makes a profit on this trans tion. He may not, it is true, but it will be more profitable consider the case in which he does, as no man will continue produce for any length of time at a loss. To what extent exchan would fall if the mints were re-opened, and whether that fall wou be relatively rapid or otherwise, may be considered. Judging fr experience, I think we have no reason to suppose that with op mints the exchange value of the rupee would deviate much from t market price of silver. On the 1st of June, 1893, silver stood $37\frac{3}{4}d.$ per ounce. The rate of exchange, Calcutta demand, w 1*s.* $2\frac{5}{8}d.$ At 27*d.* per ounce, the metallic value of the 165 grains fine silver in our rupee would be 0·836 of a shilling; or s a very small fraction over 10*d.* Mr. Gompertz believes the rup might fall to 10*d.* I think he is right in this, and I think would fall to 10*d.* within a year. The producer then, who b been selling £100 worth of produce for Rs.1,500, would be getti Rs.2,400 for it, less 12 per cent. export duty, or net Rs.2,1 But the assumption is that it paid him to sell his produce f Rs.1,500. Then much more would it pay him to sell it Rs.2,112, or in the words of Mr. Gompertz "the greater gain." There are certain reservations about this greater gain, course, in the way of payments for imports; but, as Mr. Acworth t

the Currency Committee, labour paid in silver represents about 90 per cent. of a planter's whole expenditure in Southern India. However, supposing we admit the "greater gain." Does it not strike Mr. Gompertz that this gain *ex hypothesi* raises up at once a very awkward factor? I will here venture to quote a passage from John Stuart Mill, Book III., Chap. 3, Principles of Political Economy. The writer observes: "If the value of a commodity is such that it repays the cost of production, not only with the customary, but with a higher rate of profit, capital rushes to share in this extra gain, and by increasing the supply of the article reduces its value. This is not a mere supposition or surmise, but a fact familiar to those conversant with commercial operations. Whenever a new line of business presents itself, offering a hope of unusual profits, and whenever any established trade or manufacture is believed to be yielding a greater profit than customary, there is sure to be, in a short time, so large a production or importation of the commodity as not only destroys the extra profit, but generally goes beyond the mark, and sinks the value as much too low as it had before been raised too high, until the oversupply is corrected by a total or partial suspension of further production." Now, Mill may not be always right, but I think that few people with any adequate knowledge of economic questions will deny that he is absolutely right here, and every word in the passage I have quoted might almost have been written as a reply to the scheme of Mr. Gompertz. I am not a planter, and I cannot form any estimate regarding what greater area of India might be taken up in tea or coffee, and consequently I should not like to hazard a conjecture as to how much more capital might rush in to share this extra gain. But suppose—an extraordinary supposition—no more rushed in. We must take into account the factor of competition. If it paid A., as we say, to get Rs.1,500 for his £100 worth of tea, much more, again, would it pay him to get Rs.2,112. And if it paid A., then it would pay B. But if it paid B. to sell at Rs.1,500, it would also pay him to sell at Rs.2,012 or Rs.1,912, and the phenomena of commercial competition enable us to predicate, without straining the inference unduly, that something of this kind would most assuredly take place. The benefit of low exchange to the producer would thus tend gradually but surely to disappear. And if this benefit or gain disappeared, the contemplated "export duty" would disappear also, or in other words the very source of revenue, which Government are asked to depend upon, would have a continual tendency to afford them less and less support, and eventually no support at all.

The fact would seem to be that the contrast between an exchange of 1*s.* 4*d.* and an exchange of 10*d.* with the increased rupee results in the latter case has led Mr. Gompertz and those who think with him to lose sight of certain economic facts which no amount of mere arithmetic will alter. The contrast is so great, indeed, that an imaginary profit dazzles the eyes of the advocates of the scheme. Suppose the mints had not been closed. Then, when exchange was at 1*s.* 1*d.* as it was, if Government had proposed an export duty of 6 per cent. on produce, would producers have been able to stand that shrinkage in the margin of their profits? This is a fair question, because it deals with the producer's position from a fairly normal standpoint, without such abnormal factors as closed mints for five years and a drop in exchange from 1*s.* 4*d.* to 10d. If all the tea companies in India—to speak of tea—before the mints were closed had had to pay over to Government 6 per cent. or even 4 per cent. from their sale proceeds, such percentage must have decreased dividends in the same ratio—and then, where, I will ask Mr. Gompertz, would many tea companies have been? If the factors of supply and demand and competition rendered such an export duty impossible, then, is it not clear that the tea industry or any other producing industry (as soon as the sudden low exchange profit margins were swept away—as they would be) would find its future conditions much the same as its past conditions? Why should it be assumed that they should be different?

The foregoing remarks have reference in the main to the producer who is practically his own exporter, but I must turn aside for a moment to notice a passage in "Producer's" article of the 10th instant, in which he deals with the ryot. "Producer" says: "In fact, as the duty would be paid by the exporting merchants, all that the ryot would know about it would be that he would get more rupees for his produce than he did formerly." It seems to me that there is an obscurity of thought here, which fails to recognize the true essentials of the relations between exporting merchants and ryots. The increased number of rupees, consequent on a lower exchange, equally affects the exporting merchant as it would affect the planter producer.

Any one conversant with the cotton, wheat, rice and seeds districts, knows how keen our big exporting merchants, Native and European, are, through their agents in the districts, to buy up produce, and how keen the ryot is, in his way, to do business. If an exporter with such a big margin of profit to work on can force the foreign market, he certainly will do so, and all this will certainly be reflected in ryot transactions. The very fact that such a drop in exchange would so swell rupee returns would tend to stimulate competition, over production and underselling. It is all very well to say the ryot would get more rupees for his produce than he did formerly. He would for a time—that is all. There are, of course, many other aspects in which the re-opening of the mints might be regarded. I have merely tried to point out here that this duty on exports under the assumed conditions is not at all free from very grave objections indeed, and likely to be highly uncertain, if not quite delusive, in the end. "Producer" grants there would be "some fall in gold prices and some rise in freights," and then takes up the question of increased import duties to counteract these effects. But he makes the assumed revenue from the increased import duties largely contingent on the imaginary profits accruing from a tremendous fall in exchange. The subject is worth a detailed examination, because it seems to illustrate veris forcibly the very real dangers that do wait on the re-opening of thy mints (and I for one should like to see them open *were it possible*) whatever may be urged to the contrary.

MARKET REPORT.

COFFEE.

Messrs. Wm. Jas. & Hy. Thompson's Report of the Colonial Markets for the Week ending November 9th, 1898, states :—

The spot market continues very dull, and sales are difficult. Fine qualities sold rather cheaper, other kinds being chiefly withdrawn. Brazil markets are firmer.

According to Messrs. G. Duuring & Zoon, the stocks at the European ports on the 1st inst. showed an increase of 4,400 tons, and the total visible supply an increase of 16,170 tons, being estimated respectively at 209,450 tons and 418,970 tons, against 205,050 tons and 402,800 tons on the 1st October.

Futures have fluctuated, but close decidedly dearer, prices showing an advance of about 3d to 6d per cwt., viz. :—Good average Santos in Havre, December delivery, fcs. 38.50, in Hamburg pf. 31¾, and No. 7 low ordinary Rio in New York $5.40.

Daily receipts averaged 6,800 bags in Rio and 15,800 bags in Santos.

To-day's London official quotations are :—

	Nov.	Dec.	Mar., '99.	May.	July.	Sept.
SANTOS ...	30/6	30/9	31/9	32/3	32/3	32/9

We quote :—

Receipts in Brazil to 9th November compare as follows with previous years :—

	1898-99.	1897-98.	1896-97.
	Bags.	Bags.	Bags.
RIO	1,422,000	2,073,000	1,598,000
SANTOS	3,004,000	3,568,000	2,683,000
	4,426,000	5,641,000	4,281,000

The *London Commercial Record* of 11th ultimo reports :—

The supplies at auction have been on a small scale, and a generally dull tone has prevailed, although at the close there was more disposition to bid for the low priced descriptions. No Plantation Ceylon has been offered, and the few lots of East India sold slowly. Very moderate quantities of Costa Rica and Central Americn descriptions have been brought forward, and these were only partly disposed of at easier rates. A fair amount of business has been transacted in Columbian kinds at about previous prices, with an active demand for well-picked parcels. Owing to the smaller receipts in the Brazils the terminal market has been stronger, and closes with a firm tone at an advance in prices, viz. :

London	...Santos	...December delivery ...	31s. 3d.
New York	...No. 7 Rio	... „ „ ...	5.45 cents.
Hamburg	...Santos	... „ „ ...	32 pf.
Havre	...Santos	... „ „ ...	38½ francs.
Holland	...Good ordinary Java	... ...	34 cents.

Imports, Deliveries and Stock of Coffee in London are as follows :—

		STOCK.		IMPORTS.

TEA.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea R dated November 11th, 1898, says :—

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1898-1899.	685,064 pkgs.	550,155 pkgs.	21,456 pkgs.
1897-1898.	681,551 ,,	574,432 ,,	18,487 ,,

50,262 pkgs. Indian
18,291 ,, Ceylon
1,544 ,, Java
} Total 70,097 packages were offered in public tion this week.

Good progress has been made in the export of Indian Tea direct Calcutta to foreign markets during the nine months ending 30th Sep tember. The re-exports from Great Britain also show an encoura increase.

It seems clear that both Indian and Ceylon Teas have now taken a grip of many of the most important foreign and colonial markets fact that an almost uninterrupted increase has been going on for se years past seems to show that when once a footing has been obtaine Teas from India and Ceylon, increased consumption naturally follows

Export of Indian Tea from Calcutta, for nine months ending Septe as shown by figures of the Indian Tea Association.

HIGH CLASS TAILORING.

We have now secured the services of Mr. W. J. Marden, whose experience as a Cut and Practical Tailor extends to a period of over 20 years in some of the leading houses England and India, and whom we can, therefore, confidently recommend as a veteran exp cutter. Having placed our Tailoring Department under his control, we guarantee per Fit and Style. This assurance, coupled with our proverbially Cheap Rates, will, we tr induce you to give us a trial order, which we respectfully solicit.

FREE CHRISTMAS GIFTS.

We are giving away 4 Bicycles and 200 useful Prizes. Numbered Ticket is given the purchase of every 2 Rs. worth of goods. Drawers of the lucky numbers will receive prizes free.

Indian. Prices were well supported for grades up to about 9d. per lb.—the class of Tea which furnishes the main portion of the country's consumption. Medium Pekoes and Broken Pekoes were not in such strong demand, unless in cases where the liquors were exceptionally fine. The quality of recent arrivals shows little change, Assam and Darjeeling still continuing unequal to their earlier shipments; Cachar and Sylhet have slightly improved, Dooars remaining about the same. The following official telegram was received to-day: "October outturn average, Assam; Cachar closing favourably; Sylhet and Dooars closing early."

Ceylon. The chief competition centred upon the lower grades of whole leaf Tea, all kinds up to about 7d. per lb. being bid for with considerable animation. Medium Teas were less easy of sale, and for finer grades from 9d. to 1/-, bidding was slow and a slight decline on last week's rates was noticeable. Any Teas with exceptional quality sold well. Average for week 8·51d. against 8·58d. same period 1897.

Ceylon Tea sold on Garden Account 1st Jan. to date 1898, 979,073 pkgs., av. 7·72d. 1897, 954,114 pkgs., av. 7·75d.

CHINA.—Trade continued very unsatisfactory, only small quantities changing hands at auction (where 4,734 packages were offered) until near the close, when common Congous improved in demand. Scented Caper rather dearer. Green Teas irregular. The following are the particulars of the lots sold in auction:—

half-chests Black leaf Congou, common Moning 4⅛d.
ditto Red leaf Congou, common Kaisow 4⅛d, medium Panyong 5¼d.
half-chests Souchong 6¾d.
ditto Oblong 5d.
boxes Ditto 8½d to 9d.
boxes Canton Scented Caper, medium to good medium 5½d to 7⅜d.
half-chests and cases Moyune Green, Gunpowder, ordinary to fair 5⅛d to 5¾d, medium to good medium 6½d to 8d, fine 1s to 1s 3d; Imperial, common to medium 3¼d to 5½d; Young Hyson, medium to good medium 6½d to 8d, good Sow Mee 9d to 9¾d, fine to finest Sow Mee 1s to 1s 2½d; Hyson, common 4d, medium Foong Mee 7¾d to 8½d.

INDIAN.—Sales were about on a par with the previous week, comprising 50,000 packages, against 49,700 packages, and 56,700 packages in 1897. There was a fair enquiry for the better grades, but in some instances

Broken Pekoes showed considerable irregularity. Competition was, however, keen for common to medium kinds, both leafy and broken with useful cup, which consequently ruled firm. The supply of the former is being somewhat curtailed owing to larger shipments from Calcutta to Bombay and other ports including America, the total diverted from London since 1st April to the end of September being computed at 8 million lbs. *versus* 5 million lbs. in the foregoing year. As will be also seen by the figures given below there has been a further expansion in shipments from here to the Continent, America, &c., thus affording relief to our market.

For 34,600 packages on Estate Account 8½d was obtained, contrasted with 9d per lb. for 41,800 packages, and 8¾d per lb. for 32,700 packages respectively in the two preceding seasons.

Telegrams from Calcutta state that 5a 11p per lb. was realised there for the 24,000 packages sold on the 3rd inst., and that 30,000 packages were advertised for the 11th inst.

CEYLON.—There was a reduction in the quantity brought forward, the total being 17,900 packages opposed to 24,200 packages on the 1st inst. and 16,100 packages for the corresponding period of 1897.

A strong demand again prevailed for Pekoe Souchongs and Pekoes with ordinary to fair liquor, both for the Home Trade and for Export, prices being occasionally forced up ¼d per lb., while those with desirable style and flavour, as well as Orange Pekoes, attracted good bidding and often marked an advance of ½d per lb. Broken Pekoes with coloury infusions, below 10d per lb., were wanted, but above that figure there was less desire to purchase on the part of dealers and quotations were in some cases ½d to 1d per lb. lower.

The average is 8⅝d per lb., on the 3rd inst. it stood at 8½d per lb. and 8⅛d per lb., in 1897.

JAVA.—About 1,500 packages of direct import passed with spirit without material alteration.

Deliveries.

The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns, were :—

From 1st to 8th Nov., 1898.....5,314,261 lb.
„ „ 1897.....4,931,912 „

During the week the following have been printed for sale by public auction :—

	Sold. Pkgs.	Withdrawn. Pkgs.	Total offered. Pkgs.
India	43,654	6,337	49,991
Ceylon	16,627	1,255	17,882
Java	1,414	130	1,544
Total	61,695	7,722	69,417

Also 264 packages from second hands.

CINCHONA BARK.

Only 931 packages were offered at yesterday's auctions, divided as follows :—122 bales 3 cases Ceylon (sold) : 32 bales East Indian (7 bales sold) ; 591 bales South American (500 bales sold) ; and 183 bales African (167 bales sold).

A good demand prevailed, and the bulk of this small supply sold at a further advance ; we now quote the unit at 1d.

At the auctions of 8th ultimo 1,053 bales were catalogued, but immediately prior to the commencement of the sales one catalogue containing 122 bales Ceylon Cinchona was withdrawn. Good competition prevailed, and the great proportion sold at a distinct advance (even dearer than last week's sale at Amsterdam), the unit value being now 1d, which compares with 1¾d ruling at this date last year, and ½d per lb. in 1896.

Of *South American* 591 bales offered and 500 bales sold—Bolivian cultivated Calisaya yellow quill 5d to 6¼d, soft Columbian (one lot) 2½d per lb.

125 bales, &c., *Ceylon Cinchona* all found buyers as follows : Succirubra, quill 3½d, chips 2¼d to 3½d, ditto renewed 2½d ; Hybrid, chips 4¼d per lb.

32 bales *East India Cinchona* offered and one-fourth sold at 3⅞d for Officinalis chips, and 3⅜d per lb. for shavings.

Of 183 bales *African Cinchona* offered 168 bales sold—Succirubra quill 2¾d to 5d per lb.

The dates of the sales for 1899 in London have been fixed as follows :—January 24th, February 28th, March 28th, April 25th, May 24th, June 20th, July 18th, August 15th, September 12th, October 10th, Nov. 14th, Dec. 19th.

SULPHATE OF QUININE is dearer, with sales of B & S or HB at 10½d per oz. Holders are firm.

OFFICIAL QUOTATIONS ON 11TH ULTIMO.

AMSTERDAM, November 3, 4.55 P.M. :—At the auctions held here to-d total of 634,467 kilos. of Java cinchona-bark was offered, consisting 527,163 kilos. manufacturers' and 107,304 kilos. druggists' bark. weight of quinine sulphate in the bark was 27,941 kilos. and 2,502 k respectively. Practically all sold, at an average unit of 4.67 per half-k for the manufacturing bark, against 4 05c. paid at the September aucti The following were the purchases :—American and English factories, bought the equivalent of 5,524 kilos. ; the Auerbach factory, O kilos. ; Brunswick factory, 5,805 kilos. ; the Amsterdam and Mannheim wo 8,880 kilos. ; the Frankfort-on-Main and Stuttgart works, 5,674 kilos. ; various buyers, 3,227 kilos. The prices paid for the manufacturing b ranged from 6¾c. to 45c. per kilo., and from 8½c. to 99c. for druggis The tone throughout the auctions was firm.—*Chemist and Druggist.*

Our Amsterdam representative wires us that the result of the bark a tions in Amsterdam this week was an advance of ·62 cents in the unit, average unit working out at 4·67 Dutch cents per half-kilo (rather un 17-20d per lb.) against 4·05 at the last auctions. A very satisfact feature again was the small amount bought in. The lowest price *Manufacturer's* bark was 6¾ cents and the highest 45 cents, and lowest for *Druggists'* was 8½ cents and the highest 99 cents. The ton the market was firm. Out of 7,181 packages offered, 6,724 sold.—*B. C. Chemist*, Nov. 4.

IN AUSTRALIA.

TEA.

MELBOURNE, *Nov.* 9.—*India.*—Shipments from Calcutta are 3,500, lb., as against 3,822,102 lb. same time last year.

Public sales were held on the 13th October, when 2,528 packages w sold at 6¼d to 6½d for leaf to clean pekoe souchongs; 6¾d to 7½d for fair to g quality ; 6½d to 7d for even leaf pekoes ; 7½d to 9½d for good liquors ; and to 1s for a few useful orange pekoes. Competition was good throughout sale, and prices steady to strong. On the 28th October 940 packages offe 280 of which sold at 6½d to 6¾d for good leaf pekoe souchongs, and 6¾d to 7½d for useful pekoes. Importers were not prepared to make any c cession upon top rates, and so withdrew the bulk of the offerings. vate sales have been larger than usual, but were mostly confined Souchongs and Pekoe Souchongs at 5¾d to 7d. Catalogues covering 2, packages are printed for this and next week's sales.

Stocks in bond on the 29th October were 332, 444 lb.

Ceylon.—Shipments from Colombo are 8,000,000 lbs., as against 6,702,0 lbs. at same time last year. Public sales have again been light. On the 1 October, 750 packages were offered, and 575 sold at 5¼d to 5½d for f fannings ; 5¼d to 5½d for rough leaf ; 5¾d to 6½d for even leaf pe souchongs ; 6¼d to 6¾d for even leaf pekoes ; 7½d to 9½d for good qual pekoes ; and 10½d to 1s 1½d for fine quality. On the 11th October, packages were sold at 6d for common souchong ; 6½d to 6¾d for fair pe souchong ; 8d to 9d for good pekoes ; and 10¼d to 10½d for finer quali Arrivals have been in increased quantity, which buyers readily took at f prices. There is a strong demand for all grades (except dust) up to 6½ and a steady demand for all better kinds up to 1s. Stocks in bond on 2 October were 230,747 lbs.—*From Messrs. Alfred Harvey & Co's Report.*

PEPPER.

Black.—The market is dearer, with sales of 200 tons Singapore at high prices—at 4½d for fair quality on the spot at 4⅛ Oct.-Dec. shipment, 4⅜d Nov.-Jan., and at 4 3/16d Jan.-March.

Black Pepper closed dearer. Sales of Singapore at 4 3/16d to 4⅜d. 50 t October-December sold at 4⅜d and buyers. White.—No sales.

GINGER.

Cochin.—No further development has occurred in this article, holders are firm at 27s per cwt. for good washed rough.

CARDAMOMS.

205 cases offered and about 80 cases sold as follows :—Mysore @ Ceylo good bold pale plump bleached 3s 6d to 3s 7d, medium ditto 3s 3d 3s 4d, leanish medium ditto 2s 9d, fine small 2s 8d, small 2s 6d, very sm 2s 3d ; dull pale bold 3s to 3s 2d, medium ditto 2s 7d to 2s 8d, bold medi brownish 2s 7d to 2s 8d, inferior ditto 2s 2d to 2s 4d ; Malabar @ Ceyl good pale bold 2s 11d, very brown 1s 11d ; long Native, or wild, Ceyl rather lean 3s 2d. Seeds 3s per lb.

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N. B.—Remittances should be sent to E. C. Duft & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 16th December, 1898.

Season Reports should be sent to the Printers, Messrs. Addison & Co., direct, and not to *Planting Opinion* Office.

Coorg.

Polli Betta, *7th Dec.*—*Weather.*—Dull all last week with rain on 26th, 27th and 30th ultimo; amounts not large. Largest on 26th, ·20 inch. Clear, chill, and windy this week. *Crops.*—Picking begun this side now. A good deal of crop has been got in on the western side of the country. It is reported that crops are very fine in the Sunta Koppa District of North Coorg. *General Health.*—Very fair. *Labour.*—Generally sufficient. *Interesting Item.*—Mr. Cameron's lecture at the Club was attended by nearly 40 planters.

GAS TREATMENT FOR SCALE INSECTS.

It will have been observed that one of the Entomologists consulted with reference to the importation of Ladybirds for the extermination of scale pests on Coffee expressed a decided opinion that the treatment of such pests by *gas* is the most effective. For our own part, we think the process unsuitable for use on coffee-estates, but it is certainly one that deserves more than passing notice. Poisonous gases or vapours have been used in greenhouses for years past; but it is scarcely more than a decade since their use was shown to be practicable on an economical scale in orchards as well as in greenhouses. The report of the Board of State Horticultural Commissioners of California, 1882, mentions certain unsuccessful experiments with steam. Later, Mr. Alexander Craw, the Entomologist of the State Board of Agriculture, and Mr. J. W. Wolfskill carried on various experiments with different gases. Mr. D. W. Coquillet, a special agent of the Division of Entomology of the United States Department of Agriculture, joined them, and to the last named is due the discovery of the value of hydrocyanic acid gas for the destruction of scale insects on tent-covered trees. This

was in 1886, and since then the use of liquid insecticides has been largely superseded in California by the fumigation process. It may be that the early future will witness a further evolution of the process in its application to coffee-estates, but the conditions of orchards in California and coffee-plantations in Southern India would seem to be at least as widely different as those of the former and greenhouses are. If this be so, there is a wide gulf to be bridged before proof can be given that what can be done with citrus trees in California can also be economically done with coffee trees in India.

The process under reference is doubtless familiar to most of our readers. Dome-shaped tents made of duck are used, with double crowns. Those used in California are of four sizes:—I., 6 breadths of 27 inches, 2¼ yards in length; II. 9 breadths, 3 yards in length; III. 11 breadths, 4 yards; and IV. 13 breadths, 5½ yards. A circle of gas-pipe is used to keep the mouth of each tent expanded; this circle is in halves, the ends are joined by short pieces of larger pipes into which they slip and are held in place by loosely fitting bolts passing through holes drilled through both the ends of the circle and the short connecting piece. The cloth of which the tent is made is well brushed with a mixture of four parts of boiled linseed oil to one part of turpentine. The gas itself is generated by the action of sulphuric acid on potassium cyanide in the presence of water. Those who know the cost of sulphuric acid in this country will be able to judge for themselves of the probability of their being able to generate the gas at a fair cost. The cover must be left over the tree for thirty minutes in the case of small trees and forty-five in the case of those over twelve feet in height. A number are fumigated together, however, the endeavour being to treat as many at a time as can be covered and uncovered during the period of exposure. A record number of trees fumigated during one night appears to be 190. The gas is most efficacious at night, and less damage is then done to the foliage. So that the time during which operations can be conducted is limited. As regards cost, we have some figures before us relating to experiments made in Cape Colony. The initial cost of tents and labour apart, the cyanide was estimated to cost 1*s.* 4*d.* per pound, and the acid 3*d.* The fumigation of a tree 10 feet in height and 8 feet in diameter was put at less than 2½*d.*

That the process is cheaper and more effective than spraying, would seem to be beyond question. In a report to the Horticultural Board by the Government Entomologist, Cape of Good Hope (1897), we find it stated that, in general, fumigation with hydrocyanic acid is the cheapest remedy for scale insects of citrus trees in Cape Colony, and the belief was expressed that such fumigation might be economically employed on nearly all farms in that colony where citrus trees are grown. As regards the efficacy of the gas, it was stated:—"Applied sufficiently strong and under a tight tent, every living scale insect appears to be destroyed. These perfect results are not always obtained in practice, despite of care in keeping the outfit in good order, but living scales have been found on few of the trees fumigated a few weeks after the treatment." Scale insect eggs are destroyed as well as scale insects, if the gas be strong enough. But a difficulty naturally arises in the case of such a pest as Red Scale *(Aspidiotus aurantii)* which infests not only citrus trees but also other orchard trees and many garden plants. So, too, in applying the process on coffee-estates, it would only be perfectly effe tive when applied to every species of trees infested by t special pest to be destroyed. This is a point that shou be carefully noted. More important still is the fact th hydrocyanic (prussic) acid gas is deadly poisonous to ma Potassium cyanide is as poisonous as the gas. Sulphu acid "burns" almost everything with which it is brought contact. The process is not, therefore, one that can safely left to the care of an ordinary batch of coolies their maistries. This is not the least of the reasons th influence our opinion that the process is not adapted to t circumstances of coffee-planting in this country.

BOOKS.

MR. T. FISHER UNWIN, the publisher, is sending a repr sentative out to India this season. He has forwarded us, advance, very comprehensive catalogues of his publicatio many of which deserve special notice. "The Story of t Nation" series is numbered among modern classics. It an ever-growing series of brief accounts of dismembe Empires and Kingdoms, of nations with a future as well a past, and of those great Colonies which have at prese no nationality separate from the mother-country. Admirab printed, and written by experts, these books are in effe condensed histories, full of instruction, and invaluable reference. There is now "The Children's Study" also, which different writers go over somewhat similar grou and adapt their stories to the requirements of the you "Unwin's Colonial Library" is already sufficiently well kno to need no special "bush." An excellent idea of M Unwin's is the issue of a shilling book, "Good Readi about Many Books, selected by their Authors." This co prises choice extracts from well-known novels, biographi histories, &c., with many portraits of authors. There i hint of *ex pede Herculem* about the booklet. From the f pages given you judge of the bulk, and then order a bo or books likely to suit your taste. It is a capital plan.

BOARD OF TRADE RETURNS.

October, 1898.

STATISTICS of Imports into the United Kingdom up to t end of October last include the following:—

Cocoa (raw) arrived most plentifully, and, the clearanc having diminished, the bonded stock came nearer to th of a twelvemonth since.

In the first ten months.	1898.	1897.	1896.
Imports ... ... lbs.	37,705,634	31,131,897	32,775,6
Home consumption ... „	25,956,288	23,660,572	20,891,0
Exports ... ... „	8,802,404	12,178,019	10,159,3
Stocks in bond ... ... „	18,887,000	19,255,000	25,610,0
Value of imports	£1,167,286	£829,826	£905,2
„ exports	282,800	329,084	268,3

Cocoa (prepared).—Here there was a falling off in t quantity received, but it had little effect in reducing t huge stock.

In the first ten months.	1898.	1897.	1896.
Imports ... ... lbs.	6,771,938	7,177,087	2,887,960
Home consumption ... „	5,365,071	6,470,022	2,455,020
Exports ... ... „	571,299	434,088	379,544
Stocks in bond ... ... „	1,234,000	356,000	105,000
Value of imports	£567,367	£477,152	£278,969
„ exports	62,135	48,000	43,515

Coffee.—The supply shrank to very modest dimensions, and with average deliveries, the stock in bond underwent some diminution.

In the first ten months.	1898.	1897.	1896.
Imports ... ... cwts.	870,920	681,076	631,658
Home consumption ... „	212,422	208,167	207,880
Exports ... ... „	467,758	394,408	397,268
Stocks in bond ... ... „	400,000	225,000	161,000
Value of imports	£3,558,492	£3,222,115	£3,141,831
„ exports	1,809,396	1,701,400	1,803,373

Chicory.—Home deliveries, as well as the imports, were heavier than in 1897, and the stock was practically double that in the two preceding years.

In the first ten months.	1898.	1897.	1896.
Imports ... ... cwts.	81,284	83,570	89,449
Home consumption ... „	65,962	68,862	70,485
Exports ... ... „	415	1,339	10,048
Stocks in bond ... ... „	30,000	16,000	16,000
Value of imports	£35,241	£37,117	£41,802
„ exports	419	1,361	9,381

Tea.—Both the duty-paid entries and the exports were much heavier than those in the former year; but, as the landings were considerably larger, they produced a surplus of 1,861,000 lbs. in the general stock.

In the first ten months.	1898.	1897.	1896.
Imports—China ... lbs.	22,327,378	21,967,258	29,049,172

Stocks in bond ... ... lbs.	87,691,000	85,830,000	94,167,894
Value of imports	£8,076,583	£8,070,056	£8,344,446
Of which British Indian ...	3,859,219	3,873,195	3,777,129
„ Ceylon	3,195,798	3,232,149	3,238,007
Value of exports	1,252,825	1,247,696	1,126,632

The remarkable increase in the consumption of coffee is the chief feature of these statistics, and will doubtless be taken as a high tribute to "bold advertisement." At the same time, the steady growth of home consumption and exports of coffee, the decrease in consumption of Chicory and China Tea, and the increased offtake of Indian and Ceylon teas—especially of the former—are all points of special interest to our readers. As regards stocks in bond, Cocoa (raw) and tea are in a very healthy position, while Coffee is far too plentiful. Noting the growth of demand for this article as compared with that of consumption of Tea, and more especially with the immense increase in consumption of Cocoa, it can scarcely be doubted that coffee is suffering from the want of special advertising and *push*.

In this connection, we would call special attention to the proceedings of the Shevaroy Planters' Association that are given on another page.

NOTES.

Advertising up to date—"Cribbed."

We would like to C-U-B-A customer of ours if you H-A-V-A-N-A money to spend.

Cacao.

A Matale East correspondent observes that while hitherto 1,700 pods of cacao gave one cwt. of dry nibs, this year it has taken 2,000 pods. He attributes this to the recent drought.

Brazilian Coffee.

No wonder Brazilian Coffee can be sold at lower prices than Indian, the question of quality apart! One cargo of Coffee from Santos and Rio to Hamburg recently comprised 88,000 bags. That is the sort of thing that helps to cheapen freights.

The China Tea Season, 1898-99.

As there was to be no direct steamer for the colonies after the *Australian*, which sailed from Foochow on the 11th ultimo, the China tea season virtually closed then, so far as the colonies are concerned. The total exports to date amounted to 5,750,000 lb., and was expected that 6,000,000 would cover the total for the season.

The Protection of Game in Ceylon.

A recent letter from the Colonial Secretary, Ceylon, to the local Game Protection Society stated that:—(1*st*) It had been decided to strictly prohibit the shooting of elk and deer in the hill districts (where running to the knife could be indulged in) except with the special leave of H. E. the Governor; and (2*nd*) that the restrictions placed on the export of hides and horns do not apply to trophies.

Coffee as an Auxiliary to Tea.

From information to hand—says the *Indian Planters' Gazette*—it would appear that a few gardens in Sylhet and Upper Assam are seriously contemplating putting out from 50 to 100 acres of coffee. Failures there will be, no doubt, but careful selection of land, good seed, good pits, careful planting and intelligent cultivation afterwards, ought in a great measure to reduce the failures to a minimum.

A new Arrival and a new Departure. Commenting on the fact that Mr. T. C. Anderson has left Ceylon for his tea property in the Nilgiris, the *Ceylon Observer* remarks that the new system of culture and plucking he put in force has already done wonders: crop coming in at double and treble the old rate. Presumably, this new arrival will at once set to work on the Nilgiris to give a practical demonstration of his new departure in culture, &c ?

Diogenes as Postmaster-General of Ceylon. We trust planters in Southern India are not in such bad case as their brethren in Ceylon. A recent official list of undelivered messages contains the name of "Honest on (e)": and the Postmaster-General ends the line by saying "left Ceylon." Let us hope that the addressee is among the emigrants from Ceylon to Travancore and the Nilgiris. We have Diogenes' authority for stating that he would be a "catch."

Record Prices. Commenting on a recent sale of tea in Colombo at 11 cents, for a break of 2,550 lb. red leaf, "Incinerator" dryly remarks :— It is evident that we have too long adopted a wrong system of plucking, rejecting as too coarse all "banjy" leaf. Instead of seeing estate roads untidily strewn with such leaf scrupulously picked out from the pluckers' baskets, we may now hope to see all this carefully manufactured, and the total production of Ceylon teas at least doubled.

Birds and Plants. Dr. Johow states that birds do not play so important a part in pollenating flowers as has been generally supposed. Humming-birds in particular feed on insects, not nectar, and do not carry much pollen. There is in Chili, however, a bromchad (*Paya chilensis*) which has a nectar so watery that insects do not care for it, while humming-birds and the Chilian sterling (*Curacus atterrimus*) drink it greedily. In doing so they dust their heads with pollen, and some of this is subsequently shed on other flowers.

Sunflower. The *Oil, Paint and Drug Reporter* says :—The percentage of oil in the Russian sunflower ranges from 16 to 28 per cent. On the average about 18 per cent. of oil can be extracted by expression cold after crushing the seed. This is the highest quality of oil, and any additional amount that might be extracted by steaming would be lower grade. It is estimated that 50 bushels of seed may be harvested to the acre, and roughly the yield would be about a gallon of oil to a bushel of seed. These are foreign figures, where the crop is grown for the oil.

The London Tea Market. Telegraphing to the Colombo papers on 1st instant, Messrs. Gow, Wilson and Stanton reported that the market generally was unchanged; teas with quality weak; poor liquoring sorts steady. Fair Pekoe Souchong was quoted 6½*d.*, and the average for the week 8¼*d.*, as in the previous week. Reuter wired that fine qualities were irregular and others firm; 15,000 packages sold out of 16,000 offered. Average 8¼*d.* (⅛*d.* down). The average of Indian was down ¼*d.*, standing at 8¼*d.*, and only 41,0 packages were sold out of 50,000 offered.

Colombo Tea Sales. At the sale of Tea at Colombo 30th ultimo about 7,975 pkgs. 588,486 lb. were offered, of which about 5,714 pkgs. 418,652 lb. were sold. Owing no doubt to the falling in quality of many of the teas offering, the sale passed wi a weaker tone for nearly all grades, though there was st a strong demand for all leaf kinds. Among the finest te offering were: Agra Ouvah, Glasgow, Ben Nevis, Hig Forest, Middleton, Tynmiwr and Stamford Hill. Amon low grown teas good invoices were offered from Talgaswell Chesterford, Arapolakande, Rayigam and Kelani.

Tea Estimates. At a meeting of the Dimbu Planters' Association the other d the Chairman remarked on the importance of obtaining accurate estimate. The estimate for the island last ye was put up about 15 million lb., and was reduced at t hands of the Parent Association by 7 million lb. Upon th reduction the price of tea in the London market had go up immediately. It would be a good thing, therefore, avoid sending in fancy estimates. We judge that the hi was not uncalled for, inasmuch as one member, the pr prietor of 230 acres, had estimated his crop at 240,000 lb

---

"Signed Correspondence." Various correspondents ha remarked that many, if not mo planters *will not* write to the Press except under pseud nyms, and our brief experience with the "Signed Corr spondence" section points to much the same conclusion. W regret this, and think it a very great pity; nor shall yet abandon the hope that some few will "form a ne school" and have the courage of their convictions. One thi is certain, viz., that the value of statements or criticisms c be better judged when the name of the writer is kno than when it is hidden under the mask of a *nom de plume*.

Neglected Opportunities. The story comes from London :- He was bemoaning the bad tim and the impossibility of selling his estates. "I've spe any amount in advertisements in the *Field* and other su papers, and, although I get a lot of nibbles, I never g any further." "Ceylon is a disappointing country," continued, "one is always going to do well out of it, b something always is in the way." I reminded him that n more than three years back he could have got out on exc lent terms, and asked him why he had not then realise "My partner wouldn't; he thought we should do bett later on," was the reply. 'Twas ever thus.

Tea Planting in Udugama (Ceylon). The Udugama District is 24 mil N. E. of Galle, and about 30 mil inland. A correspondent writes the *Ceylon Observer* :—I learn that there is only one t estate in the district giving over 500 lb. of tea per ac Two of the estates of about 250—300 acres in extent a worked exclusively by Sinhalese labour, the village settling in the lines on the tea estates. The planters appr ciate Sinhalese labour, being cheap without Coast advanc and attend to the wants of the labourers carefully. T

ruling wages here also are 33 cts. for adults and 25 cts. for women and 1½ cts. per lb. for picking.

Mr. Buckingham's "Green Tea."

Reporting on Mr. Buckingham's recent sample of "green tea," Messrs. J. Thomas & Co., of Calcutta, value it at 5 annas, and describe it as "Mixed Oolong kind, few ends, pale, rather new." The valuation is purely nominal, "as a sample of India green tea is practically never seen here." Messrs. Baines & Co. value the tea at 6 annas, describe it as "irregular, fairly well twisted, mixed leaf, Oolong kind, fair tip, thin, little pungent," and remark:—"This tea is scarcely a 'Green' tea, but is more of the 'Oolong' description. Oolongs of the kind made in Formosa are appreciated in America, and if tea similar in flavour could be made in India, we have no doubt it would meet with a good reception. This tea, however, does not possess much flavour."

Calcutta Tea Sales.

Reduced quality and prices marked the sale on 25th ultimo. There was a large proportion of poor liquoring Teas from Cachar and Sylhet, and less demand for all grades, excepting a few fine lots. Prices declined a quarter to a half anna on all teas worth over six annas; and two to three pies on all teas under that value. Owing to the recent heavy shipments to the Bombay market, there was less support than usual from this source. Almost sixteen thousand packages were sold on the 2nd inst. Competition was fairly brisk throughout the sale, but prices were somewhat irregular, with a slight easier tendency, partly due, no doubt, to the state of the London market, where there is reported to be generally a poor demand for common medium, and a dull demand for Bombay, while other markets outside London have improved.

The Dietetic Value of Tea.

An American scientific paper states that one pound of good tea contains about a third of an ounce of theine, two and-a-half ounces of caseine, one-twelfth ounce of volatile oil, two and-a-half ounces of gum, half an ounce of sugar, half an ounce of fat, four ounces of tannic acid. Mineral matter or ash, water, and woody fibre make up the remainder. Caseine, of which there is so large a quantity, it will be remembered, is the nutritive principle of milk; vegetable caseine, or legumen, is analogous in principle. Tea is, therefore, a highly nutritious substance, and fully capable of forming flesh and sustaining life. Peas and beans are highly concentrated forms of food, and yet analysis shows that the better qualities of tea are as rich in the nitrogenous element or nutrient principle as are these seeds. Caseine is identical in composition with the muscular fibre and with the albumen of the blood, and is easy of assimilation.

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain per ton:—

61·50 lbs. Nitrogen.
57·38 „ Potash.
14·92 „ Lime.
13·68 „ Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the 1898-1899 crop of seed from the parent trees of above analysis at Rs.6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the

MANAGER, ARIENKOW ESTATE,
Shencottah.

Ceylon Tea Exports.

Shipments of Tea from Ceylon to the U. K. in November totalled 6½ million lbs., and the estimate for December is 7¾ to 8¼ million lbs. The *Times of Ceylon* gives the following figures for 1898, which come fairly near the revised estimate of the Planters' Association, viz., 118,921,400 lbs.:—

January	10,111,251
February	8,210,418
March	11,131,202
April	8,647,155
May	12,840,550
June	12,160,995
July	12,152,764
August	8,608,170
September	8,885,712
October	8,513,733
*November	8,500,000
*December	10,000,000
	119,761,950

* Estimated: 8,000,000 lbs. has been taken for the December shipments to the United Kingdom.

Coffee Supplies for the United States.

Leslie's Weekly says that two-thirds of the world's supply of coffee comes from Brazil, and nearly half of the whole supply goes to the United States, where twelve pounds per head of population is consumed annually. The Brazilian export duty of 11 per cent. has always been considered prohibitive, but with superior coffee being produced in the Antilles and the Philippines, it is estimated that American enterprise within three years will entirely supply the United States from those sources to the detriment of Brazil. Another paper (in New Orleans) says:—"We are a nation of coffee drinkers, according to the treasury bureau of statistics which has just issued a report showing that our imports of coffee for the present fiscal year reach 870,514,215 pounds, and that the annual coffee bill for the country for the past ten years has averaged $87,500,000. We have usually purchased the bulk of our coffee in Brazil, paying chiefly cash instead of goods of our own production, and attention is now called to the fact that in the acquisition of Cuba, Porto Rico and Manilla we have secured sufficient coffee growing territory to supply our own wants in this direction." The only defect here is that there are a few missing words such, for example, as the following, to be put at the end:—"just as we shall supply our own wants as regards Tea from the estates now being worked near Charleston."

Pruning and Labour.

Mr. J. W. Gosset, a Ceylon tea-planter, writes an interesting letter to the Colombo papers on the effect of pruning upon labour in tea-estates. He remarks that the system of pruning most generally adopted is to prune large acreages in January-March and July-September, and on some estates in January-February and July-August; and that under this system it is always a case of a feast or a famine of leaf. In the famine months caused by such a system, coolies are

worked from five down to two days a week. What Mr. Gosset would call a reasonable system of pruning is to prune all the year round wherever possible; of course there are many estates that suffer from wind, drought or excess of rain during some months of the year, where it would not be possible to prune every month of the year, but on most estates it is possible; and he is convinced that it is the only system by which coolies can get practically full work all the year round. The big rushes of crop now experienced would be almost entirely avoided, and there would always be a considerable acreage ready to respond to any kind of weather. Coolies would thus get the full work that they are entitled to by law and common honesty. With full work, all questions connected with labour would improve: such as coast advances, indebtedness of kanganies and coolies to chetties and kaddie people; and, indirectly, managers of estates and coolies would be in a better position to withstand the ever-present combination of chetties up-country, and elsewhere, against them. Certainly the suggestion is worth noting, and reveals a fresh point in favour of careful pruning.

LETTERS TO THE EDITOR.

NOTICE TO CORRESPONDENTS.

HUNTER.—Declined with thanks.—ED., *P. O.*

NILGIRI POTATOES.

SIR,—Will you or any of your numerous readers let me know in what months the Potatoes are planted, and in what months they are dug out on the Nilgiris, and from where I can get good seed Potatoe to sow. AMATEUR GARDENER.

KOLINGI.

SIR,—In your issue of 26th ult. you ask whether any of your readers could help with information as to where the seeds of the Kolingi (*tephrosia purpurea*) are to be procured. A few months ago I obtained small quantities from the plains, and they thrive up here at two thousand five hundred feet. If your correspondent desires it, I will try and get some villagers to collect the seeds.

OLIVERS, NAGERCOIL, TRAVANCORE,
2nd December, 1898. } WM. H. COX.

"WANTED TO KNOW."

SIR,—Looking through the *Nilgiri News* of the 29th November, I came across a para. from the "Kulla Kumbay" correspondent to that paper with the following startling announcement:

> "100 *boxes* of cherry only give 35 Bushels of Parchment and 15 "Bushels of Tails and Light."

This equals 50 bushels after pulping. May I ask where the other 50 *boxes* of cherry have gone to?! Surely that Pulper must be leaking?! I annex my last pulping and washing:—

39 *boxes* of cherry gave—
33 bushels of Parchment (wet).
3 „ „ Tails „
3 „ „ Light „
—
39

It seems to me this is how all "cherry" should turn out, not in the same proportion, but must be accounted for in some way, either by an increase of tails or light, but to get only 50% as stated in the *N.N.*!!! There must be something wrong.

"KARTARY."

GENERAL ARTICLES.

TEA COMPANY.

Sunnygama Tea Company.—The Sunnygama (Ceylon) Tea Est Company, Limited, has declared an interim dividend of three cent.

PROPOSED NEW DUTIES IN NEW SOUTH WALES

THE *Sydney Mail* of Nov. 12th says:—Of course it remains to seen whether the House will consider the increased expenditur necessary as the Premier considers it, and whether members will be disposed to think that the elasticity of the revenue for the four months justifies a more hopeful outlook. Meantime, this ta makes it clear how Mr. Reid proposes to raise the additio revenue:—

THE NEW DUTIES.

ABOUT TEAPOTS.

THERE are, says the *Grocer*, two matters which have speci engaged the attention of ingenious inventors, viz., pipes and teap In regard to the former articles the struggle has been to make a that shall, so to speak, consume its own nicotine, and not allow to enter a smoker's mouth. With reference to tea the object ai at has been to invent a pot for the elimination of tannin from actual cup which cheers; that is, a pot which will give tea in best possible condition and free from any principle likely to

[2-10-98—t.f.o.]

injurious to consumers. The net result of these inventive ambitions, so far as they may now be observed, scarcely represents a brilliant triumph. People, generally speaking, continue to smoke the same sort of pipe they have always smoked, and they let the nicotine take its chance. Similarly as to teapots: they go on drinking tea in the usual style out of a pot that contains no grand patent improvement, and they refuse to be terrified by alarmist cries about tannin. Yet it is a fact that, during the last ten years or so, several ingenious and useful appliances have been placed on the market for the specific purpose of protecting the coats of the tea-drinker's stomach, and enabling him to enjoy his favourite beverage, perchance enthusiastically, without fear of his system being deranged. Curiously, however, tea-drinkers have not taken up these new articles with conspicuous liberality. In some instances the price has been against them; in others, they have been too complicated and if broken, have not been easily replaced. Now, in regard to tea, its two notable advantages for ordinary consumers are that it is cheap and easily prepared. It is refreshing, soothing, and it does not cost much money. Benevolent grocers fight against each other to keep prices down. *Mater familias*, who drinks tea probably three or four times a day, scoffs at the tannin bogey. She does not like a complicated or very expensive teapot. What was good enough for her grandmother—who paid more for her tea, if she did not get it better or drink more of it—is good enough for her, and she laughs at those eminent medical gentlemen who have been lifting up their voice lately in regard to this matter, and have told us all they know (not very much) about teapots. Consumers go on their way, heedless, rejoicing. The story is told how Lord Rosebery tried a new teapot, and wrote to the inventor that he would "make experience" with it, and give it a fair show. A short time after, the inventor asked his lordship what he thought of it, when the latter replied, somewhat enigmatically, that "he thought no more of the tea than before, and less of the pot," and that if anyone were enabled to drink vast quantities with impunity, the advantage to the human species might not be appreciable. After all, what comes out of the teapot depends upon what is put in.

THE COST OF TEA.

AMONG the most interesting figures we have seen lately in reference to Tea cultivation are the following, taken from the first annual report, 1897-98, of the Ceylon and Indian Planters' Association, Limited:—

ANALYSIS OF THE YEAR'S WORKING.

	Acreage in bearing and partial.	Acreage planted net in bearing.	Total Acreage.	Cost per lb. cts. Manure included.	Average London sale price per lb.	Average rate of Exchange.
Laxapana ...	688	128	1,021	29.64 Colombo.	7.23	1/3 31-32

In matters of this kind some Companies court publicity in a manner unknown to private growers. We should greatly like to have an opportunity to compare the above figures with similar statistics relating to estates in Southern India. We do not expect to have such an opportunity, however, and must console ourselves with the reflection that we are putting before tea planters in India figures that may prove extremely useful for purposes of comparison. If even only a few such planters are induced to cast out for themselves similar calculations in regard to their estates, and to note where cost exceeds and where it is under the figures given above, the purpose in view will have been sufficiently achieved.

TEA BOXES.

A GOOD deal having been said from time to time in favour of "Venesta" tea-chests, it is as well to note that there is something to be said on the other side also. Mr. John Hill, a Ceylon planter, writes:—

I got 100 of these chests in June, 1897.

I found in the first place that it was not every carpenter who could put them together, and I had to engage and teach a special man.

Next I found that the lead foil was so thin that it tore on the least provocation. The nails go through the battens, lead, and box and are supposed to rivet themselves if you have a strip of iron to nail against. This is better in theory than in practice. In fixing the top, bottom, and fourth side of a chest, the foil is pierced by 73 fasteners, and, as each of these has three points, this means 219 holes, of course possibly minute ones, but nevertheless holes. This surely cannot be good. I may have been particularly unfortunate, but the battens sent me were not all of the same length, differing as much as 7/16 of an inch, and I had to wait until Messrs. Walker sent up a fresh supply. When the break in these chests arrived in Colombo the Agents made the following remarks in a letter:—

"With reference to break of tea now in our stores we protest most emphatically against the use of Venestas, especially when the teas are to be offered for local sale. In the first place it takes a carpenter 13 minutes to open and close a Venesta chest, as against five minutes

FOR SALE.

Hybridised Maragogipe Coffee Seed. Rs.50 per bushel.

Apply to J. G. FINDLAY, Esq., *Coonoor.*

[w. 3-12-98—17-12-98.]

for a 'Momi,' and, moreover, the clumps are so damaged by the opening that we have had to purchase fresh clumps."

This letter decided me against trying any more patents. I do not think you can put as much tea into a Venesta as into a Momi, and I made the total cost of a finished chest to be 3/45 against 2/60.

Again, Mr. E. B. Creasy writes to the *Ceylon Observer* as follows :—

While free advertisements are being freely given, please let me have one.

I am the original importer of Momi boxes from Japan. Mr. Drummond Deane was the first to draw attention to and to import Cedar boxes from Japan in 1885, and I took up the business with him. It was soon found, however, that Cedar boxes tainted some of the tea which went to London, and I then solely on my own account imported Momi boxes, which have proved to be the very best tea package which has yet been introduced.

Momi boxes are cheap, light, of even tare, perfectly free from smell, and although they have never been known to turn out more tea in London than was put into them in Ceylon like certain patent boxes are said to do, on the other hand they require no clips or tin plaisters on the corners to keep them together, and they are *much cheaper* than patent packages. They have never been known to impart a cheesy or toyshop flavour to the tea, and are quite free from streaks of turpentine resin such as white pine wood frequently shows. They have stood the test of thirteen years, and while they do not contain a superfluous ounce of material in their construction, they are sufficiently strong for the purpose to which they are put. Any native carpenter or intelligent cooly can put them together, and the only implements required are a hammer and nails.

Being in large and constant demand, the supply is fully met by importers, and is not a monopoly which ensures fair prices being maintained.

THE MANURING OF TEA.

The following is from a contributed paper in the *Planter* :— Recently there has been "much ado about nothing," in the matter of the manuring of tea. Practical planters, chemists, members of agricultural colleges, fellows of chemical institutes—all have had their say, but nobody appears to have derived any benefit from the discussions and correspondence which have been going on. Nobody appears to be a bit the wiser for it all. It may be useful, therefore, if we go back to school-day experience and remind our readers that all plants are composed of a given number (13 or 14) of simple bodies necessary in the restitution of exhausted soil. Of these bodies, four, perhaps, are the most indispensable, namely, nitrogen, phosphorus, potash and lime. The three former of these, as every planter ought to know, are the chief supporters of plant life. In the event of any one of them being deficient in the soil it becomes necessary that the loss should be supplied, as, otherwise the residue of soil becomes inert and useless, and a good crop cannot possibly be expected from it. It should also be remembered that a soil analysis gives only what the soil contains at the time of examination, and not the quantity in which these constituents may be available to the plant in assimilable form during the period of growth. This is a feature in agriculture which every one interested in its development should bear in mind.

Not many weeks ago there was an admirable article in the *Nineteenth Century*, by Dr. Aikman, giving a very definite exposition of the functions of the various micro-organisms engaged in the constitution of soils, which every planter ought to study for himself if he desires to become proficient in the subject. In that paper there is quite a wealth of hints to the uninitiated, who are told that there are, besides the four elements referred to above, others which are essential to vegetable growth, and the tiller of the soil ought not lightly to regard the efficacy of the remaining ten component parts. In the *Colonial College Magazine* we read, quite recently, an article by Mr. Freer-Thonger, whose name is a guarantee for the doctrine propounded, that it often happens that the soil may contain plenty of nitrogen, phosphoric acid and potash. But any one of these ingredients may be combined in an insoluble form, in consequence of which it is absolutely useless in the manuring plants. Hence it becomes necessary to release the inert elem by the application of a more soluble combination in which th exists a large part of the value of lime. Mr. Freer-Thonger says A growing plant can find in the soil food material of which a chen with all his manipulations could hardly find any trace. To illustr what I mean, suppose I add uniformly to an acre of land defici in potash, one cwt. of kainit. Is it likely that a chemist analys a fair sample of this soil could find any appreciable difference in amount of potash and in that of an adjoining acre of the same to which none had been applied? It is, moreover, a moral certain that no agricultural chemist places much reliance upon the chemi analysis of soils. As a matter of fact, any observant enquirer find by experiment, better than any chemist can tell him, w particular element the soil he is working is deficient in. Oftentir phosphorus is one of the ingredients necessary to vegetable which is prominently deficient. Similarly, nitrogen, in any of compounds, is rarely capable of being sustained in most soils, thou it is often largely present in soils full of humus or decayed ve table matter. In such a condition, the soil will need hea applications of lime. It must, however, be always borne in m that agriculture demands more care,—continued and extended, th the mere half-hearted method of manuring. Scientific agricultu Mr. Freer-Thonger says, is based upon a complete knowledge soils, plants, animals, and manures, and it seems evident that "u these elements are thoroughly understood, no attempts at impro ment or plans for increased production can possibly be successfu In this opinion we thoroughly agree.

TEA IN THE UNITED STATES.

The *Commercial Bulletin* reports :—

The tea trade at the moment is, according to large importers a distributors, in a most unsatisfactory condition. Reports have some weeks been freely circulated that when Congress convenes December one of the first acts will be to repeal the 10 cents per duty on tea, and these reports have induced utmost conservati among buyers. Reports from salesmen in all sections of the coun indicate a disposition to purchase for immediate requirements on and as a result the tea trade is depressed.

Aside from the indisposition throughout the country to purcha the reports of the alleged disposition to remove the duties ha caused disinclination to ship tea cargoes to the United States un the duty matter is definitely settled. According to the month statistical circular of Messrs. James and John R. Montgomery & C the total shipments of tea for the United States and Canada, acco ing to mail advices from the beginning of the season to October 1 amounted to 37,457,322 pounds, comparing with 51,981,621 pounds the same date last year, while the estimated supply for the seas 1898-9 is 83,750,000 pounds comparing with 87,711,780 pounds the season 1897-8. Following are the comparisons :—

	1898.	1897.
Total afloat, October 1st ...	7,110,921	11,334,026
Receipts to October 1st ...	30,346,401	40,647,575
Total shipments advised by mail	37,457,322	51,981,621
Leaving to be shipped ...	46,292,678	35,730,159
Estimated supply, season 1898-9	83,750,000	87,711,780

Mr. A. P. Irwin, of Irwin, McBride, Catherwood and Co.: " answer to your question as to the repeal of the tea duty, we do n think there is an intelligent merchant in the United States th believes Congress would put a duty of ten cents a pound on tea June and then take it off in December of the same year; the propo tion is preposterous on the face of it and not worthy of consideratio When Congress is prepared to make any change, it will allow amp time to merchants to dispose of their stock—one year at the ve shortest. It must also be remembered that the Government h received but a small amount of revenue from this measure on accou of the stock being kept in bond, and it is reasonable to suppose th will do nothing to interfere with the present law until this stock used up and the duty is paid.

MILLIE & REDMOND, late P. THOMPSON & CO., *Ootacamund, Engineers and Contractors.*

"The tea trade to-day is in good shape; the old stock is fairly well used up, and is only sold when demand is for the lowest grades. Jobbers through the country have small stocks and have all made money. The retail merchant is having a good business, and the increased prosperity of the country is reducing his stock faster than as usual, which brings him into the market as a buyer earlier; in fact, there has been more general inquiry and buying during the present month than for three months previous, and this demand is sure to continue with increased volume during the balance of the year.

"Now, what are the conditions in the primary markets? In every description of tea they will show decreased exports, as statistics prove. The new crop is coming forward extremely slowly; in fact, vessel owners find it almost impossible to secure cargoes. These facts all show clearly that the tea trade is in an improving condition, and that any changes in the market will be for the better. There is a good selection here now of the first crop teas, and these cannot be replaced out of the later crop at any price."

Western tea men quite agree with the foregoing views that the duty will not be removed, as will be shown by the following interviews from the "Wholesale Grocer" of Chicago:

Graham Stewart, of the W. M. Hoyt Company: "By reason of the war the United States Government has a large expense account, which is still pending. The standing army is likely to be held at 100,000 to 150,000 for some time to come, and the Navy requirements, now that so much territory has come under this country's control, will greatly exceed those previous to the war. As soon as large quantities of sugar from Cuba and Porto Rico commence to come in here, free Treasury figures will show a large falling off in the duties which have hitherto been collected on imported sugars, and it is more than probable that therefore before long a duty will be levied on coffee, and perhaps several other articles to make good this deficit. In addition to the desirability of the duty on teas as a revenue measure, this duty is particularly valuable as a police measure, restricting as it does the importation of teas which are of low value and poor quality to offer to the consumer."

TEA CULTURE IN A SOUTHERN STATE.

Another paper extracts an article regarding tea cultivation in South Carolina from the *Charleston News and Courier*. This describes how a piece of swamp land was proclaimed; and how persistent efforts produced the following results: 56lbs. green leaf in 1892; 81lbs. in 1893; 151lbs. in 1894; 333lbs. in 1895; and in the present year the estimate is 1,200lbs. The article proceeds as follows:—

There are about 900 plants in this tea garden. Oriental tea gardens usually contain about 2,000 plants to the acre. The latest production to the bush in the South Carolina experiment is five ounces of tea. In Japan the average production is not more than one ounce to the bush; in China between one and two, and in India between three and five ounces. Careful reckoning has been made of the cost of production per pound, including the items of pruning, fertilizing, cultivation, leaf picking and factory work, which foot up 27½ cents a pound, and it has been possible to sell the refined tea at a dollar a pound, even without a protective duty. The first cost of a tea plantation is considerable, but relatively less the larger the area. When the plant is once well established, it is practically for all time, the best Japanese tea being gathered from bushes two hundred years old. Enough has been done to show that this new enterprise in skilful hands can be made commercially profitable, and that without treating it as an infant industry, requiring the pap of protection; though should tea culture become more general, that would probably be demanded. Sea voyages are said to impair the flavour of tea, so if we can raise a first-class article at home, we may enjoy the beverage even in as choice condition as that in which a Mandarin drinks it.

ADVERTISING A TEA.

WHEN I called on Mr. P. C. Larkin, of Salada Tea fame, I found him knee deep in an accumulation of correspondence. He had just returned from a ten days' trip of his circuit of "Salada" agencies in Buffalo, Detroit, Pittsburg, Boston and Montreal.

"Mr. Larkin, I came down to get a little story from you about advertising. You have evidently been a successful advertiser, and what you would say would be widely read and appreciated."

"Well, it is a pretty wide subject, but perhaps I can tell a point or two that will be interesting," said Mr. Larkin.

"Why did you start into the packet tea business?"

"Because after careful study I came to the conclusion there was some money in it for the man who would go into it right and work hard for success, and I believed the people would be better served than by the then present way of selling teas. I saw the many objections to it and heard the complaints of the consumer about the tea chest lying around the grocer's shop for months at a time and each day the quality of the tea deteriorating, the flavor going off and other defects, so I decided to put up tea in lead packets and advertised it, making that the strong point, and to-day one cannot turn his head without running up against the words 'Salada, Ceylon, in lead packets only,' and I verily believe every second person I meet drinks it."

"Did you begin advertising 'Salada' as advertising is understood to-day?"

"No, I tried without advertising for two years. We worked it to the extent of our ability, but eventually saw that the people must read about it every day to have it the success I was bound to make it, so I made up my mind to make my appropriation and take to advertising."

"With what result?"

"Result! Why, in the next four years the sale of Salada Tea increased twenty-fold."

"Then you attribute the wonderful demand solely to advertising?"

"No, for I realise that to have ultimate and permanent success, my article must be a better article than any one else was offering, or at least as good as the very best. I knew to be anything short of this meant fore-doomed failure."

"So you believe success in advertising depends much on having a good thing that the people must have to advertise."

"Yes, in these days it doesn't matter how good an article is, or how pre-eminently it stands out on its merits, one cannot make any considerable headway without an incessant telling the people that you have such an article for sale. Of course, if the average span of a business man's life were 1,000 to 2,000 years, he could build a considerable trade without newspaper publicity by trusting neighbour to tell neighbour its merits. After all, this would be advertising on a small scale. I advise taking to advertising as it is understood to-day."

"As to mediums, Mr. Larkin?"

"Well, there is good in all of them. 'Salada' has been tried in many of them, newspapers most largely of course; and then enamelled signs on grocers' windows; 'Salada Ceylon Tea' posters: by sampling demonstrations by handing out cups of Salada tea at exhibitions and shows. I don't know what we haven't tried, but in my opinion there is nothing equal to the daily newspapers."

"Does this conviction apply to your United States business as well?"

"Yes, to all countries. When there is a newspaper there must be readers; and the same story told over and over again, but in a new attractive dress, is bound to create a demand and hold it. A newspaper is like a human being, it can talk back. What I mean is this, that all the objections which could possibly be advanced are forcefully met from day to day until the merited confidence is established. Other mediums have not this advantage, they simply suggest. For instance 'Salada Tea is the best' is not enough to convince some people into buying it."

"About the preparation of your advertising?"

"That's a vital point and we give it the best care. The more originality and attractiveness one can put into the arguments why people should drink 'Salada Ceylon Tea,' the more likely they are to be read. If any one doubts the efficacy of good advertising, let him name to me a single article in extensive use to-day in the world that is not largely advertised. I know of none. Do you?"

"To diverge from the strictly advertising phase of the question, have you any figures as to the growth of trade?"

"Yes, I have a few, but I guess will have to give advertising the glory that they are so large as they are. Look what has been done in the United States. Only a few years ago, Ceylon and India Teas were unknown there, to-day the consumption is 15,000,000 pounds annually."

"What brought it about?"

"Ceylon and India tea planters themselves, by going in the press on a large scale and advertising the merits of the goods, and each year the consumption has been doubling and trebling and has had the effect of nearly killing off Japan and China teas. Now Japan, to check the falling off, has taken to advertising."

"What has been the result in Canada?"

"I'll only go back a year for figures. Last year from June 1st to

September 1st, there were 556,000 pounds of Ceylon tea came direct from the Island to Canada. This year, in the same period, there were 1,745,000 pounds, and besides the wonderful increase in direct shipments, the shipments from London have increased correspondingly."

"Ever felt discouraged about the ultimate success of advertising 'Salada Ceylon Tea'?"

"No, never been discouraged, but I have good reason to be many times. For instance, our Montreal agency one week's business showed $100 expenses and gross profit $7.00. But I am not a faint heart. I have faith in a good article when advertising. Now I have a good story, put it in half a dozen words for me."

"See first that the article is right, then go ahead. Success will come as sure as night follows day."—PETER RUTHERFORD in *Business*, Oct. 20th.

AN AMERICAN MARKET REVIEW.

WE do not propose to publish a lengthy report of the American Market every week, but once in a way such figures should be of interest to planters, and probably of use to those who really study them. The length at which Japanese Tea is referred to, and the figures showing the extent of importation of this class of Tea, should attract the reader's special notice. The reports are taken from the *American Grocer*.

COFFEE.

The figures named in our market reviews are for the largest lots from first hands.

Since our last the market has lost $\frac{1}{8}$c on Brazil sorts, it probably feeling the weight of supplies and moderate trade. Mild sorts are in fair request and steady at quotations, which show no change from our last, except for Padang Interior. We quote: Padang Interior, 24½@ 25½c, with fancy mats from 28c up as high as 33c: Mocha, 16½@19½c, and some fancy lots held 1@1½c higher; Maracaibo held from 6¾@13c, with Good Cucuta at 8¾c; No. 7 Rio, 6c.

Last week the following lots were sold for consumption within our range of quotations: 4,837 bags Maracaibo, 3,619 bags Savanilla, 1,000 bags Central American, 200 bags Mexican, and 503 bags Jamaica.

In transit to Europe: 112 bags Central American, 311 bags Savanila, 1,033 bags Maracaibo, 1,160 bags Hayti, and 81 bags Jamaica.

TEA.

The figures named in our market reviews are for invoices from f hands.

In an invoice way the market is very quiet. The jobbing trade slow, probably due to the special auction sale of teas by the Montgom Auction Company, comprising 13,460 packages, viz.: 406 Moyun 4,644 Amoys—very desirable invoices; 7,217 Formosas—a large a attractive assortment of all grades; 1,193 packages new c Formosas—seasons 1898-99; to be sold in Bond, but buyers w prefer to purchase duty paid can have the option of so doing adding 10½c per pound to the auction price.

YOKOHAMA, *September* 28.—There has been rather more busin doing since last report dated 19th inst., purchases during the inter amounting to 6,747 piculs. Teas ranging from 20@25 yen per pi have been most in demend. Prices have gradually weakened, s holders have shown more disposition to meet buyers. The c quality is unusually good for this time of the season. Suppl owing to bad weather, were hindered from coming forward for ab a week, and stocks consequently became reduced; but latterly arriv

are on the increase again, and there is still a large quantity of tea in this country.

Total settlements for the season to date amount to 184,519 piculs, against 197,960 piculs at corresponding date last year. Quotations :—

DISTRICT ASSOCIATIONS.

KANAN DEVAN.

MINUTES of a Quarterly General Meeting held at Munnar on the 26th November, 1898. PRESENT:—Messrs. R. Hedges, W. D. Martin, H. E. Tollemache, H. M. Knight, W. Milane, L. Davidson, G. Nicol Thomson, J. A. Hunter, T. W. Schmid, Baron J. vonRosenberg (*Chairman*), A. H. Sharp (*Honorary Secretary*), John Payne, and A. W. John (by proxy Baron vonRosenberg).

Notice calling the meeting was taken as read.

Read Minutes of last meeting. *Proposed* by Mr. Knight, and *seconded* by Mr. Hedger, that the minutes of last meeting be confirmed with the exception of the first and third paras. under the heading of Bodinaiakanur bungalow. *Carried.*

Kotagudi Road.—*Proposed* by Mr. Knight, and *seconded* by Mr. Schmid, that although this Association is not prepared to contribute as an Association to the construction of the Bodinaiakanur-Kotagudi road, it is willing to entertain any reasonable proposal by Messrs. Finlay, Muir & Co. for transporting the goods of its members, provided such rates show sufficient saving on the then ruling rates of transport. *Carried.*

Bodinaiakanur Ghat Road.—*Proposed* by Baron vonRosenberg that the Association spend Rs.700 on the Ghat Road. *Seconded* by Mr. Hedger. *Proposed* by Mr. Davidson that Mr. Sharp shall fix what share of the above sum shall be paid by the Kanan Devan Hills Produce Company. *Seconded* by Mr. Knight and *carried.*

Read letter $\frac{\text{R. C. 1483, F. W.}}{\text{21-11-98}}$ from the President, District Board, Madura, stating that the District Board Engineer had been instructed to hand over the unspent balance of the allotment for the lower portion of the Devikulam Ghat Road. *Resolved* that the Association put the work in hand at once.

Mettu Rest House.—*Proposed* by Mr. Knight, and *seconded* by Mr. W. D. Martin, that the Rest House fees be raised from 8 annas to Re.1. *Carried.*

Bodinaiakanur Bungalow.—*Proposed* by Mr. Knight that exception having been taken to the resolution passed at the meeting of 27th August, 1898, the question of the new bungalow do stand over *sine die*. *Seconded* by Mr. Martin and *carried.*

Bodinaiakanur Store.—*Proposed* by Mr. Sharp that the members of the Association making use of the old store take over the management of the same.

Proposed by Mr. Davidson that the following Committee be appointed, namely Messrs. Knight, Rosenberg, Sharp, Schmid and the proposer to decide the best arrangement. *Seconded* by Mr. Hedges and *carried.*

Votes in Association.—*Proposed* by Mr. Davidson that each estate purchased by Messrs. Finlay, Muir & Co. since the arrangement of votes was fixed by Mr. Knight, *provided* that it has not less than 200 acres in cultivation and had originally votes and vested rights in the Association should continue to hold these votes and rights. *Seconded* by Mr. W. D. Martin and *carried.*

Subscription to the U.P.A.S.I.—*Proposed* by Mr. Sharp, a*seconded* by Mr. Davidson, that the present year's subscription fixed at 9 pies per acre. *Carried.*

Proposed by Mr. Davidson, and *seconded* by Mr. Sharp, that t sum of Rs.150 be allotted towards Mr. Knight's expenses as delega at the last general meeting of the U.P.A.S.I.

The meeting closed with a vote of thanks to the Chair.

A. H. SHARP,
Honorary Secretary.

SHEVAROY.

PROCEEDINGS of a Committee Meeting of the Shevaroy Planter Association, held in the Victoria Rooms on Monday, the 5 December, 1898, at 1 P.M.

PRESENT:—Messrs. C Dickins, C. Rahm, C. G. Lechl (*Chairman*), J. C. Large, Thurston Short, Rev. J. M. Kemp and Mr. R. Gompertz (*Honorary Secretary*).

1. *Read* letter from Secretary, U.P.A.S.I., dated 22nd Nover ber, regarding classification of coffee. *Resolved* that this Ass ciation adheres to its opinion that the adoption by all *curers* o mesh of uniform size would be a step in the right direction, a would do much to make the quotations less misleading.

2. *Read* letter from Mr. Large, suggesting that steps shou be taken to promote the sale of coffee, both wholesale and reta by co-operative agency, and without the intervention of broke

Resolved that as prices of coffee have dropped to such a l point, it is, in the opinion of this Association, time that produce of the staple should now bind themselves together in the form a Co-operative Association to promote the sale of coffee direct the consumer, either in the raw state, roasted berries, or grou coffee; and that all Coffee planters in Southern India should invited to join by taking shares. That the matter should brought to the notice of every Planters' Association of Southe India by the Secretary of the U.P.A.S.I., so that the matter m be fully discussed and a plan formulated to start the concern.

3. *Read* letter from Mr. Bruce Foote, enclosing a letter fro M. Lejuge de Legrais and ten pounds of a bean recommended prevent the spread of Lantana.

Resolved that the thanks of the Association be conveyed Mr. Foote for the trouble he has taken, and that the Honora Secretary be requested to send a circular to all members of t Association on these hills enquiring whether they would li some of the seed to experiment with.

4. *Read* letter from Mr. Thurston Short, forwarding the o Rules of the Association with the alterations that have be made from time to time. *Resolved* that they be circulated to t members of the Committee who will note any alterations th propose; and that they be brought up, at the next meetin together with the proposed new Rules framed by Mr. Thurst Short.

Read and *recorded* the following letters :—

9/U.W. Circular from the Secretary, U.P.A.S.I., regardi the reduction of the British tea duty.

11/U.W. Circular from the Secretary, U.P.A.S.I., forwar ing copy of a letter received from Mr. Geo. Rouse to the Cha man regarding the classification of coffee.

15/C. Letter from Messrs. Peirce, Leslie & Co., informi that the cost of their coffee pass books is Rs.2 each.

15/D. Notification stating that the Plague regulations h been made applicable to South Canara.

Chairman.

(Signed) ROBERT GOMPERTZ,
Honorary Secretary.

HEALTH AND HARD MUSCLES.

IF John Simpson were not a blacksmith we might not have occasion to allude to him at the very outset of this writing. But he *is* a blacksmith and will thus serve an important purpose; that, too, without having to put on his leather apron to do it.

And he will do it by standing in front of his forge for five minutes while we all take a look at him. He is a strong and robust man, as Mr. Dickens's Joe Gargery was—as all blacksmiths ought to be. Ought to be, I say. But *are* they?—as a matter of fact? No, they are not—not by many a length of nail rod.

Now it is somehow a common notion that all men who work hard, especially amid rough surroundings and in the fresh air, are apt to be vigorous, healthy fellows; they are supposed to joke at doctors, to have no use for apothecaries, and even to regard undertakers as the necessity of a distant future. Is this view a true view? Are health and hard muscles always found together? Take your time to think. Meanwhile we will hear what Mr. Simpson himself says :—

"Up to the spring of 1885," he writes in a letter dated May 5th, 1893, "I was strong as most men—perhaps stronger than most. Then I began to suffer from illness. My victuals and I had a falling out. After every meal I had great pain and fulness of the chest. Then I got into such a condition that I had these feelings nearly all the while. I tried to avoid them by eating nothing but light food, but the result was just the same. I think a morsel of bread would have hurt me almost as much as a round of beef. Then I began to lose weight, and had all I could do to keep up with my work. The doctor gave me medicine, but I got no help from it.

"I was wondering how this would end when I heard of Mother Seigel's Curative Syrup and bought a bottle of it from Mr. James Crossley, the grocer at Mile Walk. The effect was speedy. It appeared to go straight to the right spot, and it wasn't long before I was able to eat without any pain to follow. Then my strength and flesh gradually came back, and ever since I have done my work as easily as I did before the disease, whatever it was, overtook me. (Signed) John Simpson, Cliviger, near Burnley."

Now, about that health and hard muscle question that I put to the reader; what's the answer? Why, of course, the answer is what any intelligent man would make who thinks with his eyes open. No; health and hard muscles are not always found together. But let us look sharp and commit no errors. The facts run this way: While a man cannot grow strong without a certain degree of health, it is also true that a notable amount of muscular power is consistent with both organic and functional trouble of the stomach, liver, kidneys, or heart. A man may be able to lift 500 pounds, and drop dead within a minute after he does it.

Sailors, farmers, miners, drivers of trams, busses, &c., outdoor labourers of different sorts (especially after reaching mid life) nearly all fall victims to rheumatism, nervous debility, or dyspepsia. Yes, and do hard work for years just the same.

I said "*or*" dyspepsia. Leave out the "or" and say dyspepsia—dyspepsia only—and you have struck bottom. This produces all the other maladies; they are merely results and symptoms of There's no keeping clear of it by running off to sea, working o farm, or diving down into a mine. No matter where you go, or w you do indoors or out, clerking in the Bank of England, or drivi the locomotive of the Scotch Express—*dyspepsia* will get hold you if you give it a chance. And most men do *that* as if they w as eager to be ill as they are to be rich. Which reminds me to t you in a subsequent article how to avoid dyspepsia. For this ti I can only speak of how to cure it. Imitate John Simpson's examp Do what he did. And remember that stalwart men (all unconscio often stand nearer a bed of pain, nearer death, than do the feel women whom they pity.

MARKET REPORT.

COFFEE.

Messrs. Wm. Jas. & Hy. Thompson's Report of the Colonial Markets for Week ending November 16th, 1898, states :—

We have no change to report in this market which continues very qu prices show no improvement, and the business done very small. Br markets are quieter.

The improvement reported in Futures continued until the end of l week, but since then prices have declined, the closing being about 1s below the highest, and 3d below last quotations, viz. :—Good aver Santos in Havre, December delivery, fcs. 37.50, in Hamburg pf. 31½, No. 7 low ordinary Rio in New York $5.30.

Daily receipts averaged 7,800 bags in Rio and 15,500 bags in Santos.

To-day's London official quotations are :—

	Nov.	Dec.	Mar., '99.	May.	July.	Se
SANTOS ...	30/6	30/6	31/6	31/9	31/9	32

We quote :—

Receipts in Brazil to 16th November compare as follows with previ years :—

	1898-99. Bags.	1897-98. Bags.	1896-97. Bags.
RIO ...	1,469,000	2,146,000	1,701,000
SANTOS ...	3,097,000	3,691,000	2,841,000
	4,566,000	5,837,000	4,542,000

The *London Commercial Record* of 18th ultimo says :—

Nothing has occurred to break the monotonous flatness in this mark The supplies at public sale have again been on a small scale, but e these have only partly found buyers. No Ceylon has been brought f ward, and the little business in East India has been in small lots of import at easy rates. Costa Rica and Central American kinds are m than usually quiet, but a fair amount of Columbian has been sold at ste prices for colory and rather cheaper rates for good to fine ordin qualities. "Futures" have shown a falling tendency, and closing pri are lower, viz. :—

London	...Santos ...	March	delivery ...	31s. 3d.
New York	...No. 7 Rio ...	„	„ ...	5.60 cents.
Hamburg	...Santos ...	„	„ ...	31¾ pf.
Havre	...Santos ...	„	„ ...	37⅝ francs.
Holland	...Good ordinary Java ...		...	33 cents.

The Dutch Trading Company announce their next public sale for Tu day, the 22nd inst., when 20,500 bags 50 cases will be offered agai 22,079 bags in 1897. Good ordinary Java is valued at 33½ cents.

	Steady. Sellers.	Steady. Buyers.	Steady. Buyers.	Steady. Value.	Steady. Buyers.

IN NEW YORK.

2nd Nov. 1898.—Since our last the market has ruled easier, No. 7 Rio ranging from 5¾ @ 5⅞c, and No. 3, or Fair, at 7¼ @ 7½c. An invoice of No. 4 Santos sold at some improvement, bringing 7c. Trading is not active. Deliveries are running behind last year at this time. There is a quiet trade in mild sorts, with Padang Interior well held from 24½ @ 33c —the latter for very fancy. Quite a stock of Maracaibo here, with prices ranging from 6¾ @ 13c. Good Cucuta, strictly up to grade, will bring, in a jobbing way, 8¾c. Mocha, 16½ @ 19½c, with some fancy grades held higher.

TEA.

CHINA.—Congous have been in only poor request since our last, says the *Record* of 18th ultimo, but Scented Capers experienced more demand in the early part of the week at very full prices, although not much sold later owing to the firmness of holders. Auctions have offered 10,055 packages—a very large proportion being Scented Caper and Green Teas—but not a great deal sold.

INDIAN.—Public auctions were rather smaller, embracing 46,800 packages contrasted with 50,000 packages last week and 46,300 packages at this period in 1897.

A steady demand prevailed for most descriptions, the chief enquiry being for fairly good to medium sorts with attractive liquor, particularly when there was a trace of cold weather flavor perceptible. No doubt the moderate range of prices ruling for these for some time past has attracted attention not only from home buyers, but also from the Continent. Common and ordinary Pekoes and Pekoe Souchongs were scarcely in so much request and occasionally easier. Fine and finest passed without material change. A larger assortment from Southern India (chiefly from Travancore) was brought forward, some of the invoices shewing improved quality and useful character.

For 32,800 packages on Estate Account 8⅜d was realised, *versus* 8⅝d per lb. for 32,200 packages, and 8¾d per lb. for 36,300 packages in the two preceding seasons respectively.

CEYLON.—Sales included 18,300 packages compared with 17,900 packages on the 8th inst. and 20,400 packages a year ago.

Competition was brisk for leafy kinds under 8d per lb., which in some cases sold fractionally dearer, but above this bidding was at times not so keen. Rates for Broken Pekoes between 10d and 1s 2d per lb. varied somewhat, though on the whole not much alteration in quotations was noticeable. Finest, however, were more wanted, and some high figures were recorded for Flowery Pekoes and Broken Orange Pekoes, notably Valamaly 1s 10½d, St. Clair 1s 8d, Talawakelle 1s 7d, Henfold 1s 5½d, Tillicoultry 1s 4¾d, Elgin, &c., 1s 3½d, Battalgalla 1s 3¼d per lb.

The average is slightly over 8½d per lb. On the 10th inst. it was 8⅜d per lb., and the same in 1897.

JAVA.—In the absence of business there is nothing to report, except that 432 packages are advertised for the 24th inst.

Deliveries.

The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns, were :

From 1st to 15th Nov., 1898	9,741,809 lb.
„ „ 1897	8,908,687 „

During the week the following have been printed for sale by public auction :—

	Sold. Pkgs.	Withdrawn. Pkgs.	Total offered. Pkgs.
India	40,564	6,283	46,847
Ceylon	16,800	1,483	18,283

1897-1898.	728,226 „	595,081 „	19,727 „

47,778 pkgs. Indian
18,727 „ Ceylon
— „ Java.
} Total 66,505 packages were offered in public auction this week.

Details of the direct exports of Indian Tea from Calcutta have recently been published by the Indian Tea Association, and afford useful information as to the localities now taking Indian Tea. Australasia, America and "Indian Ports" show a large business, while Turkey has taken a considerable quantity; that for China has probably gone to North America. Germany, Persia and Russia are all increasingly important markets.

Direct exports of Indian Tea from Calcutta (in lbs.) to places outside U. K. 1st Jan. to end September.

Africa ...	21,785		

Indian.—The market remains much in the same condition as noticed last week, although support was not so well distributed. Some of the low priced Teas were less eagerly bid for, competition having apparently been diverted towards other and better liquoring descriptions. These have lately been selling at comparatively cheaper rates and fully warrant the careful attention which buyers now appear to be giving them. The official wire gives exports to U. K. for first half of November as lbs. 9,810,000, against lbs. 9,990,000 same period 1897, making the total from 1st April to date lbs. 100,847,000, against lbs. 98,130,000 to same date last year.

Ceylon. Slight advances were here and there paid for the lower grades of Tea ranging up to 6½d., but the weakness recently noticed in the finer grades was even more pronounced, sellers being frequently obliged to accept somewhat lower prices, while the market for these grades showed decidedly irregularity. Private telegraphic advice gives exports for the first half of the month as lbs. 3,500,000, against lbs. 2,700,000 1897, and estimates the total for the month as 6,500,000 lbs., against actual shipments of lbs. 6,750,000 last November. Avge. for week 8·38d., agst. 8·58d. 1897.

Ceylon Tea sold on Garden Account 1st Jan. to date 1898, 994,850 pkgs., av. 7·74d. 1897, 970,971 pkgs., av. 7·76d.

IN AUSTRALIA.

For export 1,000 half-chests of common Panyongs taken up ex the last arrival. For home consumption 1,200 half-chests sold. Ceylons and Indians both steady, with a good demand.—Melbourne *Leader*, Nov. 12.

IN NEW YORK.

2nd Nov., 1898.—The invoice market is quiet. The Amoy market is reported by cable as half a cent higher, with good superior quoted at 15c. To-day at noon the Montgomery Auction Commission Company have their regular monthly sale. The offering consists of 3,236 packages, viz.: 232 packages Moyune; 10 half-chests Pingsuey; 118 half-chests Japan—basket-fired and sun-dried, new crop, seasons 1898-99; 30 half-chests Japan dust; 484 packages Congou—including new seasons; 131 packages India, Java and Ceylon Pekoe—including new crop; 2,231 half-chests and boxes Formosa—including invoices of new crop, seasons 1898-99.

At the auction on October 26, the small lots of greens sold at an advance of about 1c. The Amoys grading good common to fair averaged 16.54c; old crop Formosa grading good to superior, and which included tea several years old, was irregular. The average shows an advance of fully 1c. The quotations established were: Fine, 24 @ 25c; superior, 22 @ 23c; good, 22 @ 22½c; fair, 21½ @ 22c. New crop Formosa advanced ½c. One line 610 bags good to superior averaged 14·47c in bond.

PEPPER.

Black.—An active speculative demand has been experienced, and value is dearer. A large business has been done (350 to 400 tons in all), including Singapore on the spot up to 4 1 3/16d, near at hand shipments at 4 1 3/16d, January-March at 5 3/32d, and February-April at 5⅛d per lb.

The shipments of Black Pepper for the first half of November compare as follows:—

	1898.	1897.
U.K.—Singapore..... 80	80	200 220
„ Penang..... *nil*		20
Continent.....	20	270
United States.....	60	120
Total tons ...	160	610

At Wednesday's auctions, of 50 bags Singapore 20 bags greyish sold at 4⅝d, prompt 14 days. 12 bags Penang bought in at 4½d, and 560 ba Tellicherry at 4¾d to 5d per lb.

White is in good demand and dearer. Singapore of fair quality h been sold on the spot at 7⅞d to 8⅛d, and fair Penang at 7⅜d to 7 9/16d. F arrival, sales of Singapore January-March shipment have been made 8 5/16d, Penang October-December at 7½d, November-January at 7⅝ January-March at 7⅞d, and February-April at 7⅞d per lb. Sales 150 ton

The shipments of White Pepper for the first half of November compa as follows:—

	1898.	1897.
U.K.—Singapore... 110	240	60 110
„ Penang..... 130		50
Continent	50	30
Total tons.....	290	140

At public sale on the 16th ult. of 17 cases 502 bags Singapore 17 cas 65 bags sold, fine bold 9½d, fine small 8⅝d, good dullish 8d to 8⅛d, ve dull 7¾d; of 81 bags Penang 10 bags realised 7½d; 123 bags Siam retir at 8¼d per lb.

18th Nov.—Black, steady, quiet. Sales of 50 tons including a parc landing at 1/32d over 4¾d, and January-March shipment at 5 1/32d.

A Wynaad Pepper estate's production (about 20 tons) has been sold 4⅞d per lb. landed terms.

White also quiet. Sales of fair Penang on the spot at 7½d, and Januar March shipment at 7 13/16d.

GINGER.

Cochin.—All the fire has gone from the demand, and at auction of 2 cases 470 bags catalogued only 6 cases small cut and scraped sold at 3 6d per cwt.

COCOA.

This market is flat; no auctions were held on 17th ult., but privately good business had been done at lower prices.

We quote—Trinidad, middling to fine red 76s to 78s 6d, gray and mix red 75s to 76s; Guayaquil, Caraquez 79s 6d to 81s. 6d, Arriba 81s to 8 Ceylon, middling to fine 73s to 79s. Stock 108,313 bags, against 100,4 bags last year.

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N. B.—Remittances should be sent to E. C. Duft & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 23rd December, 1898.

Season Reports should be sent to the Printers, Messrs. Addison & Co., direct, and not to *Planting Opinion* Office.

Coorg.

Polli Betta, 15*th Dec.*—*Weather.*—Fine, chill at nights. East wind sometimes. *Crop.*—Getting riper. Contract picking will be on shortly. *Plant-diseases.*—Coffee in good condition except where heavily laden, which is leafless and will probably not ripen. *General Health.*—Continues fair.

COFFEE AND CO-OPERATIVE AGENCY.

In our last issue we drew special attention to the recent proceedings of the Committee of the Shevaroy Planters' Association, when a resolution was passed that it was time for producers of Coffee to bind themselves together in the form of a Co-operative Association to promote the sale of Coffee direct to the consumer, and that the matter should be brought to the notice of every Planters' Association in Southern India by the Secretary of the U. P. A. S. I. We are glad to see that our contemporary, the *Madras Mail*, has commented on this suggestion in a spirit of friendly criticism. It is impossible not to see the force of our contemporary's remark that the suggestion, vague through it is, merely touches the fringe of a very important question, and that co-operation in regard to the development of demand would be insufficient unless accompanied by co-operation for the improvement of quality and the reduction of cost to a minimum. It is, in fact, in these latter directions that South Indian coffee-planters would seem to have the best chance of success. In the ocean of Coffee consumption their product is but a drop. Efforts to push the sale would probably stimulate rivalry, and other coffees would be as vigorously pushed as Indian. It is very questionable whether the consumer could ever be induced to distinguish Indian coffee from other sorts, and to "see

that he gets it." The expense of the project would be considerable, the fruits of doubtful value; and we venture to question whether there is sufficient enterprise among our planting friends to assure the success of any such attempt as has been suggested. Money would be required; would it be forthcoming in sufficiently large amounts? The Shevaroy Planters' Association gives no hint as to the amount probably required, but all who know the cost of special efforts to cater for the retail trade and to appeal direct to the consumer in England will be aware that a lakh of rupees would not go far towards the carrying out of a scheme such as the Shevaroy Planters' Association would appear to have in view. It will be interesting to see whether the money part of the question is taken up promptly, and if any considerable amount is subscribed as an earnest that coffee-planters really mean to try to improve the position of their product.

There is, we think, grave reason to doubt the efficacy of any half measures or, indeed, of any enterprise on a small scale. At the present moment, in connection with the subject of the classification of coffee, a suggestion is under consideration that coffee curers in Southern India should be requested to adopt, as far as possible, a uniform mesh so that the "A" coffee of one curer may be as nearly as possible the same as that of another; and so on as regards "B" coffee, &c. It is anticipated that there may be difficulty about this, not merely because the shape and size of the coffee bean vary in different districts, but also because curers, or some of them, may not be willing to change their present standards. Co-operation might effect something in this direction. It might even direct its attention to the improvement of curing methods and the reduction of cost. That there is room for the latter no coffee-planter doubts, we fancy; that there is also room for the former is certain, if, as we understand to be the case, Costa Rica coffee is far superior to Indian in cleaning and curing. Then again, some years ago Baron VON ROSENBERG, in suggesting the establishment of a Planters' Bank, touched upon another disability of the Indian coffee planter, the impossibility of borrowing money whenever required on favourable terms. Co-operation might do something to remove this. The *Madras Mail* has mentioned the Coast Agent, and while we say nothing against this class we may suggest that co-operation such as has been proposed might include some new arrangement for the conveyance of coffee from estate to market. It will be found, we think, that co-operation in regard to retail sales will be useless, unless accompanied by co-operation with respect to the improvement of strains and methods of cultivation, the labour question, curing, freights, &c. In fact, co-operation must, so to speak, commence with the seed and finish in the cup. It must attend every stage of the transit of coffee from seed to cup, and must particularly guard against waste and extravagance all along the line.

The magnitude of a scheme that should embrace all this is perhaps of a character to deter the boldest among our readers from giving support to the suggestion of the Shevaroy Planters' Association, but this should not be. There is no reason why all that is here hinted at should be attempted simultaneously. Our own feeling is, however, that the resolution now referred to points to a beginning at the wrong end. We would begin on the estate and end in the consumer's house. From first to last Indian coffee should be watched. Bring the cost down a minimum, and the quality up to the highest possible lev These are the first essentials, and every advance ma towards success here will simplify the attempt to tickle t palate of the consumer. A really good article at a f price will find a market at all times; and later attemp could be made to dispense with the aid of middlemen a to cheapen, first the cost of transit from estate to mark and next, the cost of sale as between the mercha consignee and the retail trader and consumer. The obj of the resolution under consideration is admirable, and trust to see it carried out in the long run; but we certai think that eventual success will be made more sure Co-operation sketches out its proposed progress step by st *beginning at the estate.* To dispense with the Lond broker is in itself a very big proposal, though not impracticable one. It is one that South Indian Coff planters scarcely appear to be in a position to attempt j yet. However, we hope that one outcome of the Shevar Planters' Association's suggestion will be a discussion ways and means, and that before long there may be definitely formulated plan submitted.

MR. CAMERON IN COORG.

UNFORTUNATELY, we are unable to give a report of t two lectures lately delivered by Mr. John Cameron, Mercara and Pollibetta. Mr. Cameron visited Coorg the interests of Coffee. His services were kindly le for a time by the Mysore Government, so that he mig conduct certain experiments and make investigations Coorg with a view to the improvement of Coffee cultivati and the prevention of leaf-disease. He proceeded to Coo last month, and spent nearly three weeks there, visiti various coffee estates, and also having a look at the T plantation that is now there in the experimental stage. Duri his tour Mr. Cameron lectured to appreciative audienc and from the line taken we judge that his remarks mu have been rich in interest. He opened his second lecture, f instance, with his first impressions of Coorg coffee-planti as an industry. The fact that Coffee, generally speaking, looking uncommonly well would naturally have an influen on his opinion. He then referred to the conditions of plan generally, pointing out what effects change in them: du tion, cultivation, climate, fertilisation, grafting, budding, & Endemic plants are often seedless. Again, new forms a constantly arising, something like 10,000 being found Europe during this century. Touching next upon t varieties of the Coffee plant, Mr. Cameron passed to t interesting subject of sexual conditions,—those found nature and those that may be effected artificially. T object of artificial assistance is, as he observed, to obta vigour, size, shape, colour, hardihood, and fertility. T means are crossing and hybridising. Reciprocal cross are seldom possible, said Mr. Cameron. He touched up the question of reversion to the original type, and dilat upon selection of seed, and the best means of bringing abo the desired results, to achieve which requires intelligenc watchfulness and industry. While selection of seed is the utmost importance, cultivation and experiment are al needed, and Mr. Cameron included tilling, manuring, sha ing, draining and pruning within the scope of his remark Pests were also discussed, and the lecturer appropriate

closed by alluding to new products, mentioning specially Camphor, Vanilla, China grass (*Rhea*), Rubber trees, *Cryptostegia grandiflora*, Nutmeg, Florida velvet beans, and Tea. If at any time in the course of his lecture he failed to command the interest of his hearers, it was here; for the Coffee-planter is, as a rule, not keen upon new products. He is a loyal subject of King Coffee, even though at times he may vent his rebellious feelings by saying that this is an unjust and oppressive monarch. He is above all things loyal, and, despite a little coquetting with Queen Tea, Coorg is still one of the lands of the leal.

COFFEE HYBRIDS.

A CURIOUS article on "Hybrid Coffee in South India" has found its way into the columns of our contemporary the *Planter*. The writer's style of discussing his subject may be shown by a couple of extracts side by side:—

From information received, we gather that an opinion is held in some quarters that the inferences to be drawn from the *Mail* articles were too optimistic, and were therefore calculated to furnish a rosy prospect for investors which all the facts available do not justify.

At the recent Conference of the U.P.A.S.I., in Bangalore, though it transpired that Liberian Arabica (or Coorg) hybrid coffee, had been most carefully cultivated and propagated in North Mysore, neither the owners nor managers had been able to quote any returns of the yield from such hybrid coffee, which are in any way comparable with the figures published by the *Madras Mail*, the reasonable assumption following that the fertility of the Mysore hybrid does not approach that of the original hybrid trees in the Wynaad.

And though, from evidence adduced, it is shown that the Mysore Liberian Arabian hybrid coffee is "immune" from "leaf disease," and has hitherto proved to be exempt from "scale pests," there is absolutely nothing to indicate that the market value of the produce which may be shipped to London from such hybrid coffee, will touch a higher price than the highest Liberian is quoted at now, or about £35 per ton.

With regard to the probable value of hybrid coffee in the London market, while admitting that up to the present time we are without much reliable information on the subject, we believe that the hybrid berry will realise an infinitely higher price than the best Liberian; and from the fact that the character of the bean alters in a very marked degree with each successive generation of plants grown from the seed of (1) the original hybrid tree, (2) from the produce of the second generation, and (3) from the seed off the latter, both as regards shape, size and colour, and that these changes in the bean will bring the latter more "into line" with Arabica and the Coorg varieties of coffee.

There can be no doubt that some of the good original hybrid trees in the Wynaad have, during the past three seasons, suffered from "Black Bug," but, while this is an undesirable feature, we would point out that, so far as we are aware, the succeeding generations of hybrids in Wynaad have hitherto escaped the blight *in toto*, or have had it in much milder form.

We are therefore disposed to regard the future of good hybrid coffee in South India as distinctly hopeful and encouraging—provided that the extension of such cultivation is carefully conducted on the lines laid down in the *Mail's* articles.

Reading down the left-hand side, we fancy the writer thinks the *Madras Mail* took an optimistic view of the subject; but as soon as we pass on to the right-hand side we find that the writer means to support the *Mail's* remarks through thick and thin! Then comes what is probably the heart of what the writer wished to say:—

"We should strongly advocate experiments being carried out with a view to the production of a hybrid tree with C. Liberica as the seed bearer and with Waragogipe [*sic*] coffee performing the functions of the male parent."

The writer says that while Maragogipe coffee grown at elevations of and below 3,500 feet appears to be more or less prone to attacks of leaf disease, above that altitude it seems to be much less susceptible to the blight and to bear heavily, and that there are grounds, moreover, for the belief that Maragogipe coffee would command a much higher price in the London market than even P. B. Arabica. He would therefore commend his suggestion to Mr. J. Cameron, and to Messrs. Brook-Mockett, Graham Anderson, and H. G. Parsons, of Mysore and Coorg, and Mr. R. Lamb, of Wynaad. No doubt the experiment is worth trying—indeed we believe it is being tried already,—but one important point should not be overlooked, and this is that, after all, Maragogipe is merely a variety of Arabica. How far, therefore, a cross between Liberian and Maragogipe would prove superior to a cross between Liberian and ordinary Arabica in immunity from disease remains to be determined by practical experiment. Surmises and assumptions in regard to matters of this kind are not admissible.

TEA IN THE UNITED STATES.

IT is interesting to note the remarks of two trade papers on this subject, the one dealing with the Tea *trade* in the United States, the other with the infantile Tea *industry* in that country. The former, an English paper, the *Grocer*, comments on the visit of Mr. Alfred H. Ayden, of Messrs. Whittall and Co., London and Colombo, to the States, and says that he spent three weeks in the United States and Canada in the interest of Ceylon tea, which he firmly believes has a promising future. He went as far west as Chicago, which city he regards as the greatest commercial city of America. He visited the stock yards and witnessed the operation of "pig sticking," and careth not to witness the interesting slaughter a second time. He finds Ceylon and Indian tea for sale wherever he goes. The Americans use it largely for blending. Their taste calls for a light liquor and flavoury tea. Heavy-bodied sweetish tea such as England and Australia demand is not wanted. He carried away large orders, mostly for tea of a special character. He notes an increasing demand for the better grades of Ceylon. He visited the principal cities in Canada, and seems to have made a favourable impression wherever he went. And to these statements we may just add another that appears in the same paper, describing a Philadelphian establishment in which there "is a magnificent array of showcases surrounding an oblong space spanned by a triple arch, decorated with palms and ferns, and on which are the signs—Acker's Ceylon-Indian Tea; Coffee, Tea, and Cocoa Booth; Acker's Ceylon Blend Tea. Urns are kept heated, and visitors treated to a cup of tea. This feature is mentioned as indicative of the interest taken in British-grown tea, which a few years ago was not looked upon with favour.

Turning to the *American Grocer*, we find therein a timely counterblast to the mildly hysterical optimism of the Charleston *News and Courier*, which has been predicting a successful growth of "commercial tea" in South Carolina. The *American Grocer* first runs over the past history of the industry, pointing out how the industry began some years before the Civil War, when the tea plant was grown successfully in South Carolina, Georgia, and Louisiana. It was claimed at that time that one planter in Georgia obtained 440 pounds of tea from one acre of land. Nearly twenty years ago such eminent tea firms as A. A. Low and Brother and Beebe & Brother commended samples of leaf produced in South Carolina, and expressed the opinion if

the cost of production could be brought within that proper limits that leaf might be made which would compete successfully with the Japan product. Everything turns on that little "if," however. On the "Rose Garden" in South Carolina the crop of 1898 was secured at an actual cost of 27½ cents per pound, exclusive of interest on the capital invested and maintenance of the tea garden. The experimental plot returns a yield on the basis of 400 pounds to the acre. In Ceylon as high as 1,100 pounds to the acre has been obtained as the maximum production, while for high estates the average is from 300 to 450 pounds per acre. Our American contemporary then proceeds:—"There are now about 840,000 acres planted with tea in India and Ceylon, against a small patch of a garden in South Carolina. Already the production is so great that planters have been warned that the time has come for suspending further planting operations until it is seen what is to become of the additional crop (say 50,000,000 pounds at least) which the young tea is capable of producing." The average return to the tea planters of India and Ceylon last season was about 17 cents per pound—a price so low that it checked the dividend-paying power of many estates. Summing up, the American journal remarks:—"If in a tropical country, with a soil and climate peculiarly adapted to tea, with labour so abundant that plantation workers receive from 5 to 7 cents per day, it is difficult to make tea-growing a paying business, what encouragement is there for an American tea industry? The question of labour alone makes it impossible for this country to develop a tea industry, even though it were protected by a duty double that exacted by the present tariff." It is conceded that there is a belt of territory in America in which tea will grow and thrive; but the conclusion arrived at is that not until the tea estates of China, Japan, India, and Ceylon are destroyed is there a ghost of a chance to make tea-growing a successful commercial venture in the United States. Land is too expensive, labour too scarce and high, to say nothing of a total present production so far in excess of requirements that the price is continually falling.

ADULTERATED PEPPER.

"GREAT wits jump together." Quite recently, a Birmingham grocer called attention at a meeting of the local Grocers' Association to his experiences with regard to the adulteration of pepper. He said he always bought genuine pepper—at least so far as he could do that. He obtained it from a first-class London house. Recently he had in a consignment, for which he paid 1*s.* per lb., and it looked like a splendid sample, but when he tested it he concluded that it could not be genuine. He called in an expert traveller, who said it was genuine pepper as the trade understood it but it had been put through a bleaching process—through a kiln where sulphur had been used—which was a recognised rule with some London makers to make bad pepper into good. He did not consider such pepper as genuine, and thought the matter was one which should be brought before the Federation. And at much the same time as he was speaking and promising to submit a sample of the stuff he referred to, the *American Grocer* commented on one of the reports of the Ohio Food Commission, in which is a list giving the ingredients of fifteen samples of pepper analyzed by the chemist of the Depar ment. It was found that, notwithstanding the low cost pure pepper, grinders used roasted cocoanut shells, grou rice, turmeric, rice hulls, some product of wheat, cayen pepper, buckweat, hulls, and pepper dust, while so contained only a small percentage of true pepper. England the *Produce Market Review* has for years fought exposure the adulteration of this favourite spice. In recent number it states that the pending prosecutio naturally direct attention to the chemical constitution pepper, a subject in one way well known, but in anoth hardly examined as yet. The active properties of the spi depend upon the presence of an acrid resin, a volatile o and crystallizable substance called piperine or piperin. T latter is said to have no colour, flavour, or smell, and consist of piperic acid and a liquid colourless alkaloid kno as piperdin, which boils at 106 degrees C., and then sme of pepper and ammonia. The resin is very acrid, and t oil has the smell and taste of pepper. The physical stru ture of the corn is extremely complicated, and its cellul composition seems to have been carefully studied under t microscope. With all this detailed knowledge it appea as our American contemporary points out, to be wanting practical application. What is wanted from scientific m is a guide to what constitutes the intrinsic value of pepp Is it the resin, the oil, or the piperin; or must all three taken together, and, if so, in what proportions? Again it observed a very important practical question is, whether t various valuable constituents are equally diffused perpen cularly through the whole of the corns, or whether they a to be found separately into the various horizontal colour layers, from the black rind to the innermost white cent The local arrangement of the constituents is of great a increasing importance, from the immense amount of c cortication and sifting that now goes on in the search, n for the best or most pungent, but for the whitest pepp The *A. G.* adds that it is certainly the distinct impressi of those best acquainted with the trade that the whiter t pepper the worse it is as a spice. Of course, if the pub prefer a nearly flavourless white flour to a pungent da pepper, they get what they ask for, especially as the white powders, when honestly produced, are extreme expensive, and fetch a high and consequently relative profitable price. But given a taste for white flavourle pepper, it can be dishonestly or fraudulently satisfied wit out going to any great expense.

And now comes a sketch of the systems of adulterati practised, which runs as follows:—"The adulterator f years has found ground rice a cheap and harmless comm dity to vamp off as pepper, but that is a substan which the analyst can readily enough detect. The refu shavings in making buttons from white bone or earth nu would certainly not have been a substance which the c dinary mind would have selected for adulterating pepp but finely ground up it appears to yield an opening f fraud on a large scale. Sam Weller's story of the sausag maker who mysteriously disappeared, and whose sad e was only traced after a lapse of time through the wid coming across one of the deceased's trouser buttons in h sausage, however, suggests an analogous test. It appea that the analyst can detect the button refuse in pepper incineration, because the ash is so suggestively large Lastly, a suggestive observation:—"There is a mysterio

demand for empty walnut shells, in some quarters supposed to be devoted to spice-grinding. Whether they turn into pepper or into nutmegs, or mace, cassia, cinnamon, or what not, would be an interesting subject for enquiry."

In view of the expected increase in demand for West Coast pepper, this subject is worthy of the attention of our Malabar friends.

BETTER LATE THAN NEVER.

THE CURRENCY COMMITTEE.

THE HON. MR. H. P. HODGSON called upon us a few days ago, on his return from England, and it is owing to his kindness that we are able to give at this very late date the analyses of the evidence of Mr. Stephen Ralli and Sir Frank Forbes Adam before the Indian Currency Committee. It will be seen how steadfast Mr. Ralli is and how entirely he shares the planters' view of the Currency question. As for Sir Frank Forbes Adam, the most remarkable feature of his evidence is the reference to the *volte face* of the Manchester School. We are glad to learn from Mr. Hodgson that the views of Indian and Ceylon planters are really much more appreciated than they have ever been before. It by no means follows that much will be done to meet the planters' wishes, yet it is satisfactory to know that the small band that started the campaign against closed mints has now grown into a large and formidable one, and includes "strong" men such as those whose evidence is referred to below.

Mr. Stephen Augustus Ralli

Is a member of the firm of Messrs. Ralli Brothers, which was established in 1851, and carries on a large import and export business with India. The capital of the firm was placed on a sterling basis in 1873. The firm was opposed in 1893 to the closing of the mints; some members of the firm are now in favour of the policy of the Government: witness does not share this view.

Effects of a low exchange.—Low exchange encourages production and stimulates the export trade, because it enables the producer to get a better price for his produce. It causes an increase in the amount of exports required to meet the gold obligations of India. It increases the rupee price of imports, but also increases the purchasing power of the people. It enables India to compete with other countries which are at a higher stage of development. The chief advantage of a fall in exchange goes to the producer. Agricultural wages have risen to some extent, while exchange has been falling. A fall in exchange is of no advantage to the merchant. Low exchange gives a profit on wages. Cheap labour, India's only advantage in competition.

Effects of a high exchange.—High exchange places India at a disadvantage in competing with China and Japan. High exchange has injured the tea trade. High exchange is practically a tax on industry. High exchange tends to check the extension of cultivation. High exchange has checked exports from India. High exchange, together with high rates of discount, tends to destroy a favourable balance of trade, and to make it difficult for India to pay her foreign debt.

Effects of instability of exchange.—Instability of exchange has not prevented the flow of capital to India. Does not interfere with trade. A stable rate of exchange is impossible in India. Currency was not redundant in 1893.

Effects of the closing of the mints.—The currency is now insufficient for the requirements of trade. Messrs. Ralli Brothers have been able to secure sufficient currency to enable them to carry on their transactions. A crisis has been caused in India. Dissatisfaction in India. Want of confidence as to the future value of the rupee. Deterioration of the credit of the Government of India, as shown by the price of the India 2½ per cent. sterling loans. Illicit coinage. Evils of an artificial currency. If the currency policy of the Government is maintained, a very severe crisis will ensue.

Proposals for the introduction of a gold standard.—Witness is not opposed to a gold standard for India, if it were practicable, and if the rupee were rated sufficiently low; but a cold currency is not suitable for India, and a gold standard would break down. The best method of introducing a gold standard, if it were practicable, would be to make the rupee convertible into gold, and to establish a large gold fund in India for the purpose. Contraction of the rupee currency, as proposed by Government of India, would intensify existing difficulties.

Future currency policy.—Witness is in favour of the re-opening of the mints by a gradual process, and is confident that that policy will eventually be adopted. As a first step towards the re-opening of the mints the Government of India should undertake to issue rupees in exchange for gold, at 1*s.* 2*d.* the rupee, instead of at the existing rate of 1*s.* 4*d.* The existing rate of 1*s.* 4*d.* has been prejudicial to Indian trade. The existing rate of 1*s.* 4*d.* is less favourable to gold than the bazaar rate.

Probable effects of re-opening the mints.—Exchange would probably fall to 12½*d.* The cost of production of silver would prevent exchange from falling below a certain point. The ratio between gold and silver that has been adopted in Japan would not affect the exchange value of the rupee if the Indian mints were re-opened.

Loss to Government through re-opening the mints.—If the mints were re-opened, the exchange would fall, and the loss to Government should be made up by the increase of existing taxation or the imposition of new taxes. The import duties might be trebled and the countervailing excise duties proportionately increased. Export duties might be imposed, but not on tea.

Sir Frank Forbes Adam, C.I.E.,

Is an exporter of Manchester goods to India. Represents Manchester Chamber of Commerce, who objected to a gold standard for India and advocate a temporizing policy with regard to re-opening mints. Was opposed to closing of mints in 1893. Witness would re-open mints as soon as possible. Re-opening mints. Criticism of Mr. Raphael's scheme for. Import duties. Change in Lancashire opinion on. No great withdrawal of capital from India before 1893. Present system threatens prosperity of India. Discount rates in India, stringency now more prolonged and will become more acute. Stringency is caused by closing mints. Stringency due to want of currency, not of loanable capital. Indian Government's proposals, objections to. Mr. Lindsay's proposals, objections to. Exchange, reasons for present high. With falling exchange, 1873—93, India prospered. Gradual fall of rupee to 6*d.*, no fear to face. Fluctuating exchange unimportant but inconvenient. Low exchange stimulates exports. Falling exchange only partially reduces gold prices. Increase in rupee-prices of produce goes mainly to the cultivator, not to the middleman, &c. Wages follow prices slowly. Council bills do not create exports. Imports depend upon exports. Currency scarce in India. Gold standard sound in principle, but impracticable for India. Exports of gold. Silver-using countries, competition of. China, development of. Government finance, economy and additional taxation needed. Increased taxation, question of. Salt-tax difficulties in increasing.

Much of the above is merely of the character of an index, but it at least serves to show the lines along which the evidence proceeded.

PRIZE ESSAYS.

WE beg to remind our readers that a prize of Rupees one hundred will be awarded to the writer in any planting district in Southern India of the best essay on :—

THE LABOUR QUESTION.

THE PAST, PRESENT AND FUTURE SUPPLY OF LABOUR IN THE..... DISTRICT.

The following are the rules of the competition :—

1. Write on one side of the paper only.
2. Give your name in full, and state address (not for publication, except in the case of the winner).
3. Be as brief and concise as possible.
4. Cite your authorities where possible.
5. Mark your MSS., "Prize Essay Competition."
6. Submit not later than 14th January, 1899 (in Madras).

It should be clearly noted that all essays sent in will be the absolute property of *Planting Opinion*, and that the proprietors will have the right to publish them, in full or abridged or revised, in *Planting Opinion* or elsewhere, and to republish in pamphlet or book form. No limit of length is fixed, but brevity is strongly urged, and diffuseness will greatly prejudice an essay's chance of being a prize-winner. Every competitor should strive to be *accurate* and *concise*. Rupees one hundred will be remitted to the winner immediately after publication of the prize essay.

NOTES.

The Tea Duty in New South Wales. It is announced that this has been reduced to 1*d*. per lb.

The Calcutta Tea Sales. At the sales on 8th instant, about 15,000 packages were sold. The market was firm, and there was a strong demand for teas for price.

Tea in Foreign Lands. We would call special attention to the figures given in Messrs. Gow, Wilson and Stanton's report of 25th ultimo to show the expansion of outside markets for British-grown teas.

A Tea Duty for Canada. The *Ottawa* correspondent of the *Times* states that it is expected that a duty of five cents per lb. will be imposed on Tea next session. As the 25 per cent. preferential tariff applies to British Indian products, Indian Tea will gain by this move.

Ladybirds. The Government Entomologist, Victoria, has imported from Western Australia certain ladybirds that are said to be great destroyers of scale and other noxious insects. Small parcels of the *coccinellidæ* have been distributed over the colony.

A New Tea Company in Ceylon. The well-known Bambrakelle Estate and the other properties of Messrs. Wiggins Bro. and G. W. Goodeve have been made over to a limited company with a capital of Rs.12,00,000.

"Mild" Coffee. This, in New York, appears to mean coffee of a very inferior description, of which a large proportion is beans that are practically rotten. We are glad to see that a little bit of a movement in favour of pure coffee has been set going, and we hope to see it make rapid progress.

Coffee in Congo Free State. The last private advices received from the Congo Free State report that the work on the new railway from Bousa to the Chilongo River has been commenced. Extensive plantations for the cultivation of coffee, cocoa, and tobacco are being mapped out in the Mayombe district, through which the railway will pass.

The Coolgardie Exhibition. The Kelani Valley Planters' Association does not seem inclined to trouble itself much about this Exhibition. One speaker said that Coolgardie is not what it was, and when told that the consumption of Tea in Weste Australia has been estimated at 9 lb. a head, he retorted "But that was in the year 1897. There is nobody there now

"Kolingi." *Indian Gardening* states th the *Tephrosiæ* are leguminc plants, closely allied to the Indigo. The *Tephrosia purpur* the "Kolingi" of Southern India, is a most valual medicinal plant with the natives of India, and our conte porary thanks that seeds of it could be had in the baza The Indigo plant, ploughed into the soil, is said to fertil it wonderfully.

Gainers by Exchange. Writing in *Capital*, a gentlem who modestly signs himself "J spots the gainer by Exchange. It is the Coolie. "T good time" for this atom of humanity is, says "J," wh "the sahib is getting lots of rupees for his tea and indig the intrinsic value of the rupee in relation to gold is not ing and carries no weight with it, only as regards t European staff."

The Lantana Bug in Ceylon. An Uva writer says the lanta bug is said to be flourishing Judge's Hill, Badulla—import from the Peradeniya Gardens, it is reported! As remarks: "It would not take long to spread through t province; and if there is trouble in its track, it will be po comfort to know that the Principality has to thank t Royal Botanical Gardens for the gift of the blight."

Cardamoms. We take the following from th *London Commercial Record* of 25 ultimo:—Cardamoms have for some time past only enjoy a good demand from that portion of the trade using fi sorts, whereas ordinary descriptions have been sad neglected. The Ceylon crop seems to be a good one quan tatively speaking, and the Tellicherry one, we hear, promis to turn out a fair one, both as regards quantity and qualit

The London Tea Market. Telegraphing to Colombo 8th instant, Messrs. Gow, Wils and Stanton reported a steady market, and quoted fair liquoring Ceylon Pekoe Souchong 6½*d*., average of Ceyl Tea for the week 8¼*d*.—the same figures as in the previo week. Reuter reported on the same day that 15,000 pac ages Ceylon Tea had been sold out of 16,000 offered a also quoted no change in prices. The average of Indi Tea was, however, 7⅞*d*., showing a fall of ⅜*d*. Out 47,000 packages offered, 40,000 were sold.

Crop Estimates. Mr. Chas. H. Bagot, of Nuwa Eliya, questions the utility of est mates of the tea crop to the planter, and says:—"Of the har that erroneous estimates have caused we have recently ha

R. VENKIAH BROS.,
PHOTOGRAPHIC ARTISTS, 161, MOUNT ROAD, MADRAS
SPLENDID OFFER TO THE PUBLIC.
RX. Send us your Photograph, and we will reproduce a beautif enlargement, framing size 18×14, highly finished in monochrome witho injury to original, framed complete, Rs.15.
NOTHING EQUAL TO THESE IN THE CARNATIC
[2-10-98—t.f.o.]

a very practical lesson. These estimates may be valuable to the trader and buyer. Their usefulness to the planter is questionable; and their accuracy more than doubtful—*vide* the case quoted at the Dimbula P. A. meeting, and there are doubtless many such instances." He then asks:—Is there any other commodity, such as coffee, sugar, tobacco, wool, etc., of which the producer publishes yearly estimates for the guidance and benefit of the buyer?

Coffee in Ceylon. A correspondent writes from the Uva district to the *Ceylon Observer*:—The old King Coffee is putting on quite a regal appearance this year at Haputale. Whether it is that the planting of tea through the coffee, where tea was before spurned at, has had any effect, certain it is that the coffee crop this season is remarkably fine—what a wealth of it! Berries clustering everywhere and crowding out each other in all stages of ripeness. "Not expected that the trees will be able to carry it, is what was told me." Is it, he asks, a new version of the song of the dying swan, which was always sweetest with death in sight?

A Planters' Manual! It is not often that a "good story" is told that has a planter for its hero. However, the *Planter* gives one *apropos* of a gentleman who had a craze about manuring. Manures occupied the Manager's thoughts by day and dreams by night. Every article or book written on the subject was eagerly devoured. One day in perusing his paper he saw advertised "The Soil" (La Terre) by Zola, and, thinking it was a treatise on soil generally, sent for it. He was not only surprised but a trifle disgusted to find the opening chapter give a very full and minute detail of other matter. The volume was passed over promptly to the assistant, who, it is thought, was neither surprised nor disgusted.

Indian "Green" Tea. Mr. W. Gow, of Messrs. Gow, Wilson and Stanton, has reported as follows upon a sample of the Hon. Mr. Buckingham's "green" tea:—"There is no tea on this market at all like it, so that it is difficult to arrive at any value; a few chests of this tea might sell at a fair price, perhaps 7*d.* or 8*d.*, but I question much if 100 or 150 chests came on to the market, you would get anything better than 6*d.* It has a pale yellow pungent liquor, and reminds me much of some Japanese green teas I have seen, and which latter is used mostly in America." It seems to us that Calcutta and London reports on this class of tea are valueless. We trust that an *American* report will shortly be forthcoming.

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain per ton:—

61·50 lbs. Nitrogen.
57·38 „ Potash.
14·92 „ Lime.
13·68 „ Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the 1898-1899 crop of seed from the parent trees of above analysis at Rs.6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the

MANAGER, ARIENKOW ESTATE,
Shencottah.

A Boom in Pepper. The *London Commercial Record* observes:—Values in some articles, such as Pepper and Cinnamon Chips, have been driven up with such rapidity that they have inspired intending bull operators with fear; they therefore abstained from coming in, and the pause in the upward movement thus created has induced fortunate speculators to sell their holdings and be satisfied with the profits they had realised. It is, however, generally anticipated that a renewal of the recent boom, particularly in Pepper, will shortly take place, and we are given to understand that a large number of bulls are only awaiting lower prices in order to give fresh support to Pepper.

"The Agricultural Ledger." The two latest numbers are Nos. 14 and 15 of 1898, the former a "Report on the Coal Supply of India," which is a matter of only indirect interest to most planters, the latter dealing with Rhea (Riha) or China-grass. This runs to 129 pages, but as cultivation in Madras (and Mysore) is dealt with in about three pages, we can scarcely think that South India planters take much interest in rhea. Various experiments have been made in the Wynaad and elsewhere, but while experience has been gained, money has been lost. As the *Ledger* says:—"It will be time enough to think of experiments in other parts of India when it has been proved that North Bengal and Assam can produce the fibre at a profitable rate, "for there the most favourable local conditions obtain."

A Tea-maker's Handbook. Mr. G. T. Pett (Ceylon) has a work in the press, divided into four parts. Part No. 1 contains the general duties of all those connected with a factory, and a section is devoted to each, from the tea-maker to the watchman. Part No. 2 is headed "Manufacture," and Mr. Pett goes through all the different processes, from when the leaf enters the factory till the time the tea is sold in London. In these days of low prices, any remarks on how to improve our teas should claim wide attention, and the author gives many useful hints on this subject. Part No. 3 contains a list of all the machines now in use. It goes on to detail their work—how to get the best possible results—and gives simple directions for their general working. Part No. 4 is a mass of useful information for any factory. The care of lamps, belts, &c., is impressed on the tea-maker, and there are many notes about tea requisites.

The S. of I. Planters' Enquiry. The *Madras Mail's* Calcutta correspondent wires:—"I understand that the question of remedying the disabilities of South Indian Planters in connection with their labour supply proves a harder nut than was at first anticipated; and further reference will have to be made to the Secretary of State in connection with it. The Government of India is about to address the Madras Government regarding the introduction of a Bill in the local Council to deal with the subject; but it will probably be years before the Act which will eventually result comes

FOR SALE.

Hybridised Maragogipe Coffee Seed. Rs.50 per bushel.

Apply to J. G. FINDLAY, Esq., *Coonoor.*

[w. 3-12-98—17-12-98.]

into force, for it not only raises the whole question of the powers of arrest in Native States, but difficulty is also caused by the limitations of the breach of contract provisions in the existing Contract Law."

A New Company. The Timber Tea Chests Company, Limited, was registered on Nov. 3 in England with a capital of 8,000*l.* in 1*l.* shares, to carry on the business of timber merchants, dealers in and manufacturers of tea chests, tea wrappers, and other articles used in connection with the import and export of tea; also the business of tea merchants and agents for the sale of veneer tea chests; and to enter into an agreement with the "Ceylon and General Syndicate (Limited)." The first subscribers are:—Alexander J. Rouse, 92, Bouverie-road, Stoke Newington, secretary; Alexander von Koettlitz, 13, Foulis-terrace, Onslow-gardens, S. W., accountant; Guy Owen, 45, Tavistock-square, W.C., merchant; Edward Ames, 52, Lee-terrace, Blackheath, wharfinger; Edward Langley, 41, Montagu-road, Dalston, N.E., secretary; William T. Laurie, 4, Kildare-gardens, W., late tea estate inspector, Ceylon; and F. W. Woodman, 89, Bethune-road, Stamford-hill, N., clerk.

Russia as a Tea-Grower. Serious attempts are now being made, says the St. Petersburg correspondent of the *Financial News*, to introduce in Russia the cultivation of tea, especially in the Caucasus, where, according to official statements, experiments so far made have given very satisfactory results. During the current year about 400 Chinese families have settled down in Southern Russia with the special mission of initiating Russian planters into the secrets of this branch of agriculture. The tea fields are situated in the immediate neighbourhood of the sea, running along the Batoum-Tiflis line. The harvest, on a grand scale, is to begin shortly, with the help of the Chinese, who are kept here by contract, and are already getting accustomed to the climate. At the same time, I may mention the announcement, which I have been unable to verify, that a German syndicate, including well-known capitalists, is about to found colonies in the Crimean regions of Alma, Katscha, and Balbeka, where tea, cotton, and sugar-cane plantations are to be established.

"The Indian Sportsman." The first number of this paper made its appearance in Calcutta on the 3rd instant. It does not propose to enter into competition with its older contemporaries, the *I.P.G.* and the *Asian*, but states that its distinctive feature will be its illustrations, "which will principally comprise phototypes, highly executed, of sportsmen, horses, athletic and polo teams; and snapshots of passing events. The journal will contain further very full discussion of all matters appertaining to the turf; take a keener interest in polo than has yet been done by any other paper; chronicle passing social events in a pleasant chatty way: deal technically and instructively we hope with planting interests, and give athletics and all other branches of sport due attention, and not neglect the stage, as much as we have of it in India." A fairly comprehensive programme. Here's to the success of its framers and those who have to place the pieces on th stage.

LETTERS TO THE EDITOR.

"BOXES" AND "BUSHELS."

SIR,—In reply to "Kartary" in your issue of 10th Decen ber, will he kindly measure, say, 10 struck bushels (*n* boxes) of cherry, pulp it, and give us the outturn of parchmen tails, and light? A box of cherry may mean anything fro 1¼ to 2 bushels, and even more. Every estate, I fancy, has i own pet *box* for measuring cherry. "Kartary's" *box* mu measure nearly 2 *bushels*.

INDIAN AND CEYLON TEA AND INDIAN EXCHANGE

MR. W. MARTIN LEAKE, Secretary of the Ceylon Association London, writes to *The Financial News* as follows:—"The repo that your representative gives in your paper of 18th inst. of h interview with me is in the main correct; but he is under some litt misapprehension when he describes me, without qualification, 'optimistic as to the future of Indian and Ceylon teas.' It is tru that the increase of shipments to foreign and colonial market during the present year encourages the hope that with a continue increase of production these markets might be captured for British grown teas in the same way as the home market has already bee captured. But unfortunately, in the meantime the unprecedented low rupee price ruling for our teas is making the business unprofi able to the producer, and checking the increase of productio essential for the occupation of the new markets. It is said, I kno that the low prices are due to over-production; but this hypothes will not bear inspection. The fall in the rupee price of tea dat only from 1896. Let us see how far a comparison of the statistic position of tea to-day with that of two years ago bears out the a sumption that the subsequent very serious fall in price has been du to excess of supply over demand. The following figures for th movements in the tea trade in the United Kingdom for the fou months, June to October, 1896 and 1898, are taken from Messrs. Gow Wilson and Stanton's circular of 4th inst.:—

	1896. lb.	1898. lb.	lb.
Imports	...127,812,513	123,704,622	−4,107,891
Deliveries	...105,416,706	110,626,987	+5,210,281
Stocks, Oct. 31	... 88,331,246	80,653,561	−7,677,685

"I may add that in no other country than the United Kingdom ar heavy stocks of tea kept. The matter then stands thus:—We ha

MILLIE & REDMOND, late P. THOMPSON & CO., *Ootacamund, Engineers and Contractors.*

up to 1896, with constantly-increased production and increasing stocks—a steady rupee price. From 1896, while the Indian Government has been successfully forcing up the value of the rupee to 1s. 4d., we have had, in face of a greatly-strengthened statistical position, as shown by the above figures, a sharp and continued fall in that price. It is idle to contend that the fall is due to over-production."

WHEN TO CUT TREES FOR LUMBER.

WITH proper after treatment of the wood, the time of felling does not seem to affect its durability. Winter felling is generally preferable to summer felling because both fungi and insects are then inactive and the timber may be handled more at leisure, both in the woods and during shipment and conversion, and if worked up at once has a chance to season to quite an extent before warm weather awakens its many enemies. Where logging and milling are carried on in a large way and the log is cut into boards and these put through the dry kiln before the fungi and beetles have a chance to attack them, the product of summer felling is as good as that of any winter felled timber.

Where logging is done in a small way the cutting of timber in summer usually involves loss and commonly leads to inferior product. (B. E. Fernow, Circular 20, forestry division U S dept agri.) Peeling standing timber and allowing it to season on the stump is often recommended, but has never found favour in this country. Girdling timber to partially season it is done for cypress, but with indifferent success.

CEYLON TEA IN AMERICA.

THE following interesting letter from Mr. S. Elwood May, dated New York, 29th October, contains some valuable suggestions as to methods to be adopted and to be avoided by those who wish to push Ceylon and Indian Teas in the States. Mr. May writes to the *Ceylon Observer*:—

To the Ceylon Planters. It may be of interest to you to learn the views of an American on the work done here which I shall give to you with malice toward none.

If it were only necessary to win success in Ceylon tea culture in your Island, to have the requisite amount of money to purchase land, clear it, and follow the ideas of an inexperienced individual, then any one with money might set sail for Ceylon with success assured and be independent of the old planters or their experienced co-workers. All your representatives have come to this country feeling that your backing meant assured success, and is all that is necessary.

This is shown by the fact that they ignored everyone who have laboured here for years in British-grown teas.

The stranger here, generally after he has spent his money, sees that there is a concrete mass of combinations to fight. The wholesale merchant whom he has won, under the rose, is working with the people he always has been, and pushing the old article harder than ever. All the large houses here count upon tiring out and using up the funds of newcomers, before they find out that they have a hold of the wrong end of the stick. I have recently travelled over the New England territory, and British-grown tea has the name of an exploited failure. To win success in the introduction of an article, to replace a well-known staple product in this country, is indeed a task, and must be handled from basic principles; the different localities such as the Eastern States, the Southern States, &c., &c., require different treatment, and great experience to get enough of a foothold to have the business go on. Things that move slowly are generally doomed, every one helps to execute them to get them out of the way. It has hurt Ceylon to attach India to it; first it is confusing, second it appears from all the advertising that Ceylon and Indian Tea mixed is the only beverage to use, not Ceylon Tea alone, oh no. It is the most arrant nonsense to say that the way to introduce Ceylon tea is to push India tea also. China and Japan tea, they have been introduced separately and against each other. Having won a place here, the merchants advertise for sale China and Japan Tea. You might as well say that the way to introduce Bass ale is to add Guinness's stout and use Bass & Co's money to do it with. There is a reason for everything, and I know why they are working Ceylon and India together, but the courtesies that obtain among decent-minded people seal my mouth. You will not get this market to any large extent until certain things are done, they have not been done, and while some good has been accomplished, not enough of an impetus has been given to the enterprise to make it lasting. Your money has largely been spent by Englishmen to get experience. If you think they have accumulated enough of it to win success, the thing to do is to go on; if you stop, every thing will pretty much be thrown away. It is not fair to count Canada imports with North America. Canada was won before you spent any money here, and readily yielded to any efforts made owing to your own people being largely there.

THE CEYLON TEA CESS.

THE *Observer* remarks on the proposed increase of the Tea Cess, and says things that will scarcely be palatable to the executive of the Planters' Association. After remarking that there are indications of approval of the proposal of the Thirty Committee upcountry, while in Colombo the sentiment is decidedly the other way, our contemporary proceeds:—

The object for which this voluntary tax exists is the "Advertising of Ceylon Teas in the Markets of the World," and the helping of those who are prepared to work in our interests for the opening out of new centres of tea consumption. This clear and well-defined policy has been departed from in the apportionment of salary for Mr. Kelway-Bamber, and now that it has been seen how easily this Planters' tax can be got at, and to what extent it can grow, the Thirty Committee is expanding also,—and would expand further, if only more money could be got in.

It was a decided mistake—the hitching of Mr. Kelway-Bamber on to the Tea Fund. It broke faith with those who agreed to pay a Tea Cess for advertising purposes, and it introduced a principle which would justify the Thirty Committee in almost any kind of outlay, if but connected with the industry. A new tea chest might be subsidized: a tea-roller financed; or even the man who could show nothing but whose ideas were fertile and whose means were small might be run on the Cess contribution in the hope that the ultimate good would justify the outlay. Mr. Kelway-Bamber's mission is quite desirable, and good will no doubt result from the outlay; but that the expense of the mission should have been a charge on the Tea Fund is a bad move. Not to speak of the breach of faith, the policy was short-sighted. For ever so long there has been a steadily-swelling cry for a Scientific Department of Agriculture to be maintained at public expense, and although the Government is even in these days of big surpluses not very willing to move, still a Commission has been appointed. It is a big sum which has been appropriated locally, but no doubt the planters will get value for it; for the laboratory may have secrets connected with fermentation which will much benefit the teamaker to know; but when the Thirty Committee has thus easily voted away a thousand a year for a scientific advisory expert, and with equal light-heartedness proposes to increase the cess, it is about time that there was a halt called, and a return to first principles.

Besides all this, we are told there are some estates which feel the present Tea Cess a burden. Running so close to the cost of production, everything tells, and to increase any item makes the problem of getting along all the more difficult. The burden at present is weighty enough, and the fund to be distributed sufficient and with a natural growth of its own; it is only the Thirty Committee who feel hampered, and it is perhaps as well it should be, until the trend of its action is less questionable, and it developes a single eye for the pushing of Ceylon Teas in the New Markets of the World.

In conclusion, might not the Government be very well requested to recoup to the Tea Cess Fund all outlay on account of Mr. Kelway-Bamber and to take over his mission and services as specially for the benefit of the industry which has contributed most to the existing General Revenue surpluses exceeding four millions of rupees?

Criticising the above remarks of its contemporary, the *Times of Ceylon* says:—

Much of the foregoing condemns itself. Mr. Bamber's work is much too valuable to be dismissed in the way attempted. When he was appointed, the need for such an enquiry was admitted to be great and immediate; and nothing would have been done if the Thirty Committee had not acted with promptitude. Our contemporary is very belated with its objection; and does not appear to know the difference between the competition of rival tea machinery makers and the investigations of a scientist.

INDIAN TEA.

WHILE the *Pall Mall Gazette* and some other papers despond, the *Grocer* rejoices that its forecast of the market for Indian Tea, published last April, has proved to be correct. It then said that, "Before new Indian Teas will arrive to any appreciable extent, say July or August, the existing heavy stock may be considerably reduced, and this will the more thoroughly prepare the market for the fresh consignments, so that when more suitable supplies appear on offer it is probable that a stronger demand at firmer prices will prevail than has been noticed for any length of time within the last twelve months."

All these changes have, says our contemporary, come about in a remarkable manner. First, it will be noticed that the stock of Indian tea in London, which at the end of March was 59,051,500 lbs., in opposition to 51,289,350 lbs. in 1897, and only 45,729,500 lbs. in 1896, has since then, and by the 31st ult., been reduced to 44,947,000 lbs., against 45,123,000 lbs. and 44,048,700 lbs. in the two preceding years. These figures show a diminution in the quantity on hand of 14,104,500 lbs. in seven months, and an entire disappearance of the cumbrous surplus that weighed the market down in the early part of 1898. At that time the deliveries of the same description of tea at this port, which we next refer to, were of only average amount, being for the first quarter of the year 34,373,350 lbs., against 34,311,850 lbs. and 33,376,100 lbs. in 1897 and 1896. Since then, however, they have made astonishing strides onwards, and for the past ten months have reached the hitherto unmatched total of 112,455,100 lbs., in contrast with 103,672,200 lbs. in the corresponding period last year and 100,527,650 lbs. in 1896.

Here again appears the surprising increase of 8,782,900 lbs. over the delivery of Indian tea in 1897, eclipsing all former records, and confirming, in a striking degree, the "stronger demand" that, so far back as last spring, was looked forward to with well-grounded confidence by both importers and dealers. It should, however, be explained that a portion of the augmentation in the above clearances is due to the larger quantities taken for exportation from the United Kingdom this year, which, as officially returned, have equalled 5,984,850 lbs., as compared with 4,235,750 lbs. in the ten months of 1897, and 2,901,950 lbs. in the previous year. The separate entries of the same kind of tea for home consumption from January 1 to Oct. 31 aggregated 108,506,200 lbs., in lieu of 102,567,350 lbs., and 99,732,160 lbs., respectively, in 1897 and 1896. As we have repeatedly observed in our market reports, the demand has run chiefly upon the common and low medium leafy sorts, from 5¼d. to 8d. per lb., teas "for price" being, more than ever, a prominent feature of the season. At its commencement quotations were at a moderate level, and on comparing them with those for similar grades of Ceylon, it was at once seen that Indian teas offered decidedly better value for money. The latter, therefore, have served as a great boon to the big blenders of packet teas and exporters on continental account, and, inquiries having gone on increasing rather rapidly, subsequent purchases have been made at gradually hardening rates.

In alluding to the size of the present season's crop of Indian tea, we can speak in only general terms, as no detailed statement, giving the yield for each important district under cultivation, has yet been received. The nearest approximation to what the total production is likely to reach is that contained in the "revised" estimates forwarded from Calcutta to the Indian Tea Association (London), which put the aggregate crop for 1898-99 at 154,000,000 lbs., as contrasted with a trifle over 148,000,000 lbs. actually grown in 1896-97 and 1897-98. Of this season's crop it is reckoned that 136,000,000 lbs. will be available for the United Kingdom, which is about 4,000,000 lbs. below what was orginally estimated, a 2,000,000 lbs. more than in 1897. The statistical position of t article, as at present, is thus represented to be more favourable th it was at the beginning of the new season, and the improvement mainly owing to the largely expanded shipments direct from C cutta to "outside countries," such as Australasia, America, Bomb and sundry ports, which from April 1 to September 30 (t latest date named) embraced 8,099,100 lbs. in comparison w 5,204,400 lbs. last year and 5,710,800 lbs. in the year before. these means, and the additional demand from shippers that h arisen here, the home market has been sensibly relieved of accumu ting and excessive stocks, and prices instead of declining have be pointing towards recovery, a tendency which will probably maintained for some time to come.

COFFEE AND CO-OPERATIVE AGENCY.

THE *Madras Mail* remarks that there is food for much thought the Resolution passed by the Committee of the Shevaroys Plan Association at its meeting on the 5th instant. The Committee th resolved "that as prices of coffee have dropped to such a low poi it is, in the opinion of this Association, time that producers of t staple should now bind themselves together in the form of a C operative Association to promote the sale of coffee direct to the co sumer, either in the raw state, roasted berries, or ground coffee; a that all coffee planters in Southern India should be invited to jo by taking shares. That the matter should be brought to the not of every Planters' Association of Southern India by the Secretary the U.P.A.S.I., so that the matter may be fully discussed and plan formulated to start the concern." Our contemporary commen as follows:—

In its way, the suggestion here made is an excellent one, but t Resolution leaves a good deal to the imagination, and, to our mi merely touches the fringe of a very important question. For stance, there will certainly be men to question the practicability any scheme of co-operation such as has been suggested. If t Association had worked out a plan, however roughly, so as to sh something of a practical and practicable kind, other Associatio could have criticised, suggested modifications, and so on; and so definite result would probably have been arrived at in a short tim As it is, there is a somewhat vague suggestion for the various Pla ters' Association to consider. Unless a meeting of delegates arranged, discussions by correspondence may be prolonged, witho any substantial result. For, if we assume that recommendatio will be made, we must also anticipate that they will vary greatly points of detail, if not in regard to first principles. Who is to und take the work of blending the good among the suggestions and d carding the bad or the unworkable? It is, we think, a pity that t Shevaroy planters did not boldly grapple with the problem and su mit a plan for approval or revision. The saving in time would, in probability, have been appreciable, and the chances of a defin result would have been largely increased. The ground covered the Resolution, though in our opinion far from wide enough, is wide that there is room for multitudinous differences of suggesti and opinion on minor points. If each Association that is interest were to formulate a plan of action, it would probably be a Hercule task to reconcile one with the others. If, as is not unlikely, eve Association hesitates to undertake the task, what progress can hoped for?

Reverting to our remark that the ground covered by the Reso tion is not wide enough, we would observe that the Resolution relat solely to co-operation in regard to efforts to increase the demand f and the price of coffee. Now, considering how very small a pla India occupies among the coffee-producing countries of the world, would seem almost as if a mouse of an Archimedean turn of mi were seeking a lever wherewith it might raise an elephant to a high level than that on which it now stands. Is it possible, we may as for Indian coffee-planters by any means to bring about an appreciab increase in the demand for Indian coffee? True, they may dispense wi the broker and start co-operative agencies for the wholesale and ret sale of Indian coffee, and Indian coffee alone. But would this pay The number of merchants and dealers in the United Kingdom—

for that matter in the world—who trade in coffee alone is insignificant. Narrow the scope down to Indian coffee, and you put the establishment upon a virtually unworkable basis. Coffee is usually sold by grocers; and unless the retail co-operative agencies thought of opening regular groceries and sold other provisions in addition to coffee, their chances would be small. True, rivals to "Ye Mecca" might be started, for the sale of Indian-coffee in the cup; but this can scarcely be regarded seriously as a means of increasing demand or consumption. We should have preferred to see not only a definite scheme of co-operation for the purposes of stimulating demand, but a scheme of co-operation in regard to the cultivation and curing of coffee. It is the high cost of Indian coffee that blocks the way of the planter to profit and prosperity. It is there that co-operation is most called for. There are middlemen and middlemen. There is the broker in England who effects a sale and pockets a commission. There is the curer in India who takes something to repay him for his work. The Coast Agent, again, does not give his services free.

Without saying "get rid of those middlemen," one may at least throw out the hint that coffee planters might try to arrange so that the remuneration of the curer and the Coast Agent should be revised, and, if excessive, reduced. Theoretically, no doubt, co-operation is an excellent thing; but even the few remarks here made, mere outlines though they be of the comments that might be made on the Resolution of the Shevaroy Planters' Association, should suffice to show that the practical application of co-operative principles is attended with many difficulties.

SOILS, MANURES, ETC.

THE TAKING OF SAMPLES.

MR. A. BAUR, of the Ceylon Manure Works, Colombo, offers to make Soil Analyses *free of charge*. We are not aware whether this offer applies to planters in India as well as in Ceylon, but on this point we are making inquiries. Mr. Baur has a Chemical Laboratory in charge of Dr. T. Bachofen, Analytical and Agricultural Chemist (Diploma of the Institute of Chemistry of Zürich, Doctor's Degree of the University of Zürich for Special Investigations). We note that Mr. Baur urges that soil samples should be taken to a depth of one foot for annuals and to a depth of three feet for perennials. Doubting if these instructions are sufficiently precise, we give for the information of our readers the following instructions issued by the Queensland Agricultural College with respect not only to Soils, but also to Water, Manures, &c.:—

INSTRUCTIONS FOR TAKING AND COLLECTING OF SAMPLES.

Soils and Subsoils.

To obtain a fair average sample of the soil of a block of land, as near as possible, equal quantities of soil are taken from various parts of the fields.

A sketch plan of the field, paddock, or block of land on which the samples were taken should accompany the samples, and the spots where samples are taken are marked on this plan and numbered. This sketch plan should also indicate position of roads, creeks, gullies, ridges, general fall of the land, &c.

Should the soil in various parts of the block show a very marked difference, it will be necessary to divide the block into two, rarely in more, parts. Should the different soil occur only in a small patch, this sample may be left out.

Not less than three samples should be taken in each section. A greater number is to be preferred, as a better average will be obtained.

At the places chosen for the taking of the samples the surface is slightly scraped with a sharp tool, to remove any surface vegetation which has not as yet become part of the soil.

Vertical holes from 10 to 18 inches square are dug in the ground to a depth of 2 feet 6 inches to 3 feet.

The holes are dug out like post-holes; an earth-auger facilitates the operation considerably, and the holes may be trimmed with the spade afterwards.

Careful note of the appearance of the freshly cut soil and subsoil should be taken. The depth of the real soil, which in most cases is easily distinguished, is also measured and noted for each hole. Note how deep the roots of the surface vegetation reach into the soil. If the soil changes gradually into the subsoil, as is the case in some places where the soil is of very great depth, this line of division is guessed approximately, or it is best to take the soil uniformly to a depth of 12 inches.

With a spade a slice of soil is now cut off and put on to a clean bag. The same is done with the subsoil, and the slice is taken from where the soil ends (or 12 inches) to the bottom of the hole, and this subsoil placed on another bag. Stones over the size of a pea may be picked out, the rough quantity of such stones estimated, and a few enclosed with the samples. Fine roots must not be taken out from the soil samples. The same operation is repeated at the other places chosen. Careful note and description in each hole, as numbered and marked on plan given, and the samples of soil collected on the one bag thoroughly mixed by breaking up any large clods, and about 10 lb. of the mixture put into a clean canvas bag, which is securely tied up and labelled. The same is done with the samples of subsoil collected on the other bag.

All the samples collected are afterwards placed into a wooden box.

It is important to use clean bags and clean boxes, and also that the samples should not be left in the neighbourhood of stables or manure heaps.

A short description of the land must accompany the samples and the sketch plan.

In the case of cultivated land, state how long the land was under cultivation, what crops were chiefly grown, result of such crops, was any manure applied, and what sort and in what quantities per acre. In the case of virgin soil, state if the land was heavily timbered or not, ringbarked, if scrub or forest land, what sort of timber was chiefly growing on the land. In all cases a description of the neighbouring land, outcropping rocks, &c., are of great value. Also state if the land is naturally or artificially drained or not; describe the land as regards its position to hills, roads, creeks, &c.

Only by adhering strictly to these instructions, and by giving minute details, benefit can be derived from the soil analyses.

Water.

It is best to collect and forward samples of water for analysis in stoppered glass bottles, generally known as Winchester quarts.

The bottles have to be perfectly clean, and stoppers must fit well. Corks should be avoided, but if used must be new and well washed with the water before being used for closing the bottle.

When taking waters from taps, pumps, bores, the water has to be allowed to run for a while before taking the sample. When taking the water out of a well, pond, or river, the bottle is completely immersed, but care has to be taken not to disturb the mud or sediment at the bottom of the water. Before the sample is actually collected, the bottle is rinsed three times with the water, filling each time about one-third full. The bottle is then filled within about one inch from the top; the stopper is inserted and securely tied down with a clean piece of linen or calico.

The stopper must not be fastened or luted with sealing-wax, paste, plaster of Paris, &c.

Manures.

When taking samples of artificial manures out of bags, the samples must be taken from different bags and at different places of the bag, and not only from the top, or the bags before being used are emptied on a heap and mixed up well and the sample then taken. About 1 to 2 lb. put into a clean bag should be forwarded for analysis.

Food Stuffs.

It is always important to obtain good average samples, and this can only be done by great care in taking the samples from different places, mixing well, and taking a small part of the mixture. This method would apply to any dry food-stuff, as grains of any kind, peas, beans, chaff, pollard, meal, &c. For the analysis of green foods, as green hay, sorghum, silage, it is best to make a mixture of the sample by passing it through a chaffcutter, and by taking an accurately weighed quantity, say 1 lb. This quantity may then be dried in the sun, taking care that nothing is lost, and when dry put in a bag and forwarded for analysis. The green samples may be forwarded without drying in fruit-preserving jars.

To collect information about value of green manures, it is best to plot out exactly one square yard in the field covered with the plant, not picking out a position where the growth is very heavy or poor, but about a fair average. Four pegs are driven into the ground at the four corners, and string stretched between them; with a sharp

spade all the plants are cut along the strings, so as to get really the growth of one square yard. The plants are all collected and accurately weighed, passed through a chaffcutter, and the sample for analysis taken as above described. In many cases the roots may be also pulled out, weighed separately, and a sample forwarded.

The samples have to be accompanied by a description of the crop when planted, how old when cut, if the land was manured or not, weight of crop per acre or square yard, and weight of the sample forwarded when in its green state. In the case of green manures it is generally best to take the samples at the same time when ploughed under, just after flowering.

NITROGEN AND PLANTS.

The Madras Mail gives the following report of a lecture on "Atmospheric Nitrogen in its Relation to Vegetation" delivered by Dr. W. J. Leather, Agricultural Chemist to the Government of India, at the College of Agriculture, Saidapet, on Tuesday last:—

The lecturer, in introducing the subject, thought it would be as well to set out briefly the reason why it occupied and still occupies an important place in the field of agricultural research. Early in the history of chemistry it was determined that all plants were built up of two distinct classes of substances, one of which became dissipated on heating while the other did not. The composition of the latter, or mineral, portion was only accurately determined later on, but it was readily recognised that the plant must rely entirely on the soil for a supply of its mineral ingredients. Regarding the portion which was dissipated on heating it was discovered last century that this portion consisted of compounds of carbon, hydrogen, oxygen and nitrogen: and it has been known for over half a century that plants obtained the greater portion if not the whole of their carbon and a part of their oxygen from the atmosphere, and that most of the water entered through the root, the supplies of these substances being practically unlimited.

The question was whether plants obtained their nitrogen from the soil or from the free nitrogen of the atmosphere. The first experiment was made in 1779 by Priestly, who, working with primitive apparatus, came to the conclusion that plants assimilated the free nitrogen of the atmosphere. Twenty years later De Saussure, as the result of his experiments, came to the opposite conclusion. In 1837 Boussingault investigated the matter with indecisive results, but he again attacked the subject in a more thorough manner in 1850 and subsequent years. He grew plants from seed in a soil which was capable of supplying the necessary mineral matter, but which did not contain any compound of nitrogen. The whole was enclosed in a large glass sphere, which was occasionally supplied with carbon dioxide, a supply of water being given to the soil. In this way the compounds of nitrogen were as far as possible put out of reach of the plant while the free nitrogen of the atmosphere was in contact with it. His experiments showed that the nitrogen in the plant was practically the same in amount as that originally contained in the seed—in other words that the plant did not assimilate atmospheric nitrogen. These results were subsequently confirmed by other experimenters, notably Lawes, Gilbert and Pugh, of whose apparatus and methods of procedure the lecturer gave a detailed account with the aid of the neccssary appliances.

The question could not be allowed to rest here, for there was a generally expressed opinion among British farmers that clover, in addition to producing excellent crops of hay, enriched the soil for a succeeding crop of wheat or barley, and further that all competent investigators admitted that the question, in spite of the results already mentioned, was not fully solved, while some of the field experiments seemed to confirm the British farmers' opinion. Hellriegel and Wilfarth carried out a series of investigations on the relation which existed between the amount of plant food in the soil and the weight of crop obtained. Plants were grown in sterilised soil in a series of pots having a good supply of plant foods other than nitrogen. In one pot of a series there were no compounds of nitrogen present; in a second pot a small amount of combined nitrogen as sodium nitrate; in a third pot twice as much and so on. It was found that in the case of the *Graminaceæ* and some others that the weight of plants produced depended largely on the amount of combined nitrogen supplied, but that with the *Leguminosæ* the yields varied. Further, the striking fact was demonstrated that pea plants grown in sterilised soil with no supply of combined nitroge in some cases grew luxuriantly, while in other cases their growt was limited to the supply of nitrogen in the seed. The roots of th stunted peas resembled those of other plants, but the other c the luxuriant peas had developed numbers of nodular protuberance The question was, therefore, raised, whether this phenomeno was in any way connected with the action of micro-organisms c microbes. Further experiments showed that the *leguminosa* did not thrive in cultivation pots from which all micro-organ isms were excluded, that these plants developed nodules o their tubercles and thrived well if the cultivation pots wer watered with muddy water obtained by slaking fertile soil wit water, but not if this water was previously sterilised by boiling. Th lecturer then described the experiments in detail and summarise their results as follows:—Plants belonging to the natural order *Graminaceæ, Cruciferæ*, etc., did not assimilate atmospheric nitrogen plants belonging to the sub-order *Papilionaceæ* (order *Leguminosa* assimilated atmospheric mitrogen if certain micro-organisms wer present in the soil. The experiments of Hellriegel and Wilfart have been corroborated by Lawes and Gilbert. The lecturer the proceeded to give in detail the evidence tending to prove that th nodules mentioned were due to inoculation, and said that certai bacteriologists had separated organisms from these nodules. Nobb it appears, has grown these organisms and has placed them on th market in suitable vessels (" Nitragin ") so that soils deficient in th organisms may be supplied with them. Regarding the practic utility of " Nitragin " the information at present available seeme insufficient to base any opinion on the matter. The lecturer incide tally pointed out that some of the lower forms of vegetable life such a *Algæ* and *Lichens* seemed to be capable of assimilating free nitroge which accounted for the phenomenon noticed by some observe that land left apparently bare showed an increase in the amount c nitrogen present. The question " in what way do bacteria assi certain plants in assimilating atmospheric Nitrogen" was answered b Lawes and Gilbert as follows:—" The alternative explanations c the fixation of free nitrogen seem to be:—1st, that under the cond tions of the Symbiosis the plant is unable to fix the free nitrogen c the atmosphere by its leaves; 2nd that the organisms become distribu ted within the soil and there fix nitrogen; the resulting nitrogenou compounds becoming available as a source of nitrogen to the root of the plant; 3rd that the free nitrogen is fixed in the course of th development of the organisms within the nodules, and that th resulting nitrogenous compounds are absorbed and utilised by th host." The third suggestion seemed the most likely one.

Leaving aside the purely scientific aspect of the question, th lecturer said he would like to deal with the practical side of it. I was true that through the agency of pulses the land became enriche to a certain extent for a subsequent cereal crop. But experiment carried out at Cawnpore and elsewhere showed that the root residu of a pulse crop could only be relied upon to increase the cereal whic filled it by about ten per cent., which was very little compared wit the increase which could be obtained by the use of nitrogenou manures. Doubtless the part played by pulse crops in India was a all-important one, but it would be folly to trust to such crops alon to replenish the soil and to neglect the use of cattle dung and othe manures supplying nitrogen to the soil. The soils of India wer very poor in nitrogen; and this left only one conclusion to be drawn namely that, although our pulse crops were annually assimilatin some nitrogen from the atmosphere, the amount so brought int combination with the soil was not sufficient either to increas naturally the store of this all-important plant food, or even to main tain it at a high level.

THE WORLD'S GOLD AND SILVER OUTPUT.

THE Director of the American Mint Bureau, who is looked upo as the leading authority in the computation of the world's output o gold and silver, has issued his Report for the past twelve months.

Last year's gold output throughout the world is valued at £47,500,000 which establishes a record. This compares with £41,200,000 for 1896 £39,860,800 for 1895, £23,769,740 for 1890, which really means tha the world's production of gold has doubled itself in seven years. A is well known, the United States, for the first time in its history, las year ranked second as a gold-producer, having been superseded b the Transvaal. The difference, however, is comparatively very smal

the United States product being figured at 57,363,000 dols., while that of South Africa is put at 58,306,000 dols., of which the Transvaal produced 57,633,000dols. As regards this year's output, the Transvaal will fairly outdistance the United States as a gold producer. The world's production of silver for last year was 183,096,090 oz., which for coining purposes was valued at 236,730,300 dols. Here also a record is established, the next greatest production being shown in the previous year, when 167,500,900 oz. was the total. The United States had an output which was valued at 69,637,200 dols., being a slight decrease on the previous year. The Australasian total was £4,124,840, which was also a slight increase. Bolivia had a production valued at 19,393,900 dols., as compared with 28,444,400 dols. in 1894. The Spanish output was valued at 7,473,300 dols.

RECONSTRUCTION OF A WELL-KNOWN TEA FIRM.

We take the following from a London financial contemporary:—

Dodwell & Co., Ltd., Registered November 11th, with capital £100,000, in £25 shares, to acquire the business carried on by G. B. Dodwell and J. H. Carlill, in the colony of Hong Kong, at Shanghai and Hankow, China; at Kobe and Yokohama, Japan; at Tacoma, Washington, and Portland, Oregon, U.S.A.; at Victoria, B.C., and at Dock House, Billiter Street, London, as Dodwell, Carlill, & Co., and to carry on the business of merchants, exporters, importers, ship-owners, carriers, agents, brokers, stock-keepers, &c. The subscribers are:—

	Shares.
G. B. Dodwell, Dock House, Billiter Street, E.C., merchant ...	1
A. J. H. Carlill, Dock House, Billiter Street, E.C., merchant ...	1

J. H. Champney, 103, Cannon Street, E.C., C.A.	1
H. H. Stewart, Dock House, Billiter Street, E.C., merchant ...	1

The number of directors is not to be less than 3 nor more than 10. The first are:—G. B. Dodwell (Chairman), A. J. H. Carlill, F. D'Iffanger, G. S. Thomson, E. S. Whealler, F. Dodwell, T. M. Dermer, H. A. J. Macray, and W. L. L. Grant; qualification, £1,000; remuneration £100 each per annum, and £200 for the Chairman.

THE CHINA TEA TRADE.

Says the Hongkong *Daily Press*:—The Indian and Ceylon tea planters use as one of their arguments against a high exchange value of the rupee the bounty that cheap silver is supposed to confer upon China tea, thereby favouring the competition of the latter. So far the bounty, if there is any bounty in the matter, has done little good to China tea, the trade in which is steadily declining, the advantages of cheap silver weighing but as a feather in the scale against the heavy disadvantages of excessive taxation and primitive methods of cultivation and preparation. Mr. F. E. Taylor, the Statistical Secretary of the Imperial Maritime Customs, in his report on the foreign trade of China for 1897, expresses a belief in the possibility of reviving the tea trade. "I believe," he says, "that the experiment commenced at Foochow, and shortly to be initiated at Hankow, will, if sufficient leaf can be procured close to the factory, eventually result in a success which will encourage the adoption of similar methods in other centres of the tea industry and will regain for this important trade a large measure of its former prosperity." It is possible that this opinion may be justified by the result, provided that with improved methods of growth and preparation there also goes some considerable measure of relief from the present scale of taxation, for the industry could not possibly flourish, however well conducted as regards cultivation and preparation, so long as the State continued to lay excessive burdens upon it. Relief from illegal or excessive taxation is one of the results that may be expected from the direct participation of foreigners in the industry. Prohibitive import duties imposed for the protection of home industries may admit of some defence on economic grounds, but what shall be said of a Government that taxes its export trade out of existence by prohibitive duties? While that policy continues in respect of China's tea trade the Indian and Ceylon planters need have little fear of any formidable competition being nursed by variations in the gold value of the dollar and rupee.

PRICES OF COMMODITIES.

MR. A. SAUERBECK, in his usual circular relating to the prices of commodities, states: The following are the index numbers of the prices of 45 commodities, the average of the eleven years 1867-77 being 100:—

Average.		Monthly Numbers.	
1878-87 ...	...=79	July, 1896 ...	59·2
1888-97 ...	...=67	December, 1897	62·4
1889 ...	...=72	May, 1898 ...	66·4
1893 ...	...=68	June, 1898 ...	64·7
1894 ...	...=63	July, 1898 ...	64·3
1895 ...	...=62	August, 1898	64·0
1896 ...	...=61	September, 1898	63·9
1897 ...	...=62	October, 1898	63·6

During the month of October prices for corn were, on the whole, maintained, a reduction in the case of oats being balanced by a rise of maize. Sugar and coffee were also scarcely changed; but pork, bacon, and butter ruled lower. Metals and petroleum, on the other hand, experienced a distinct rise, while for textiles and hides the tendency was downward. Taking articles of food and materials separately, the index numbers compare thus—

	June, 1896.	Dec., 1897.	May.	Sept.	Oct., 1898.
Food	59·4	66·5	71·5	66·2	65·0
Materials.	59·3	59·4	62·7	62·3	62·7

The divergence of prices which has existed since the middle of 1896 is getting gradually smaller, and, while articles of food are now 2 per cent. lower than at the end of last year, materials stand $5\frac{1}{2}$ per cent. higher. The prices and index numbers of silver were as follows (60·84*d.* per oz. being the parity of 1 gold to $15\frac{1}{2}$ silver=100):—

End Aug., 1897	$23\frac{7}{8}d$=39·2	End July, 1898 ...	$27\frac{1}{16}d$=44·5
End Dec., 1897	$26\frac{5}{8}d$=43·8	End Sept., 1898 ...	$28\frac{1}{4}d$ =46·4
End Mar., 1898	$25\frac{11}{16}d$=42·2	End Oct., 1898 ...	$28\frac{1}{4}d$ =46·4

RUSSIA AS A TEA-GROWING COUNTRY.

CEYLON enterprise has done yeoman service to Indian tea. It has introduced the thin end of the wedge into Russia by forcing in the course of last year two million pounds of tea on its markets. This, says a daily contemporary, is a beginning which should indicate good prospects for the Indian article as soon as our planters succeed in adapting these methods to Russian taste, and producing tablet tea of the flavour required, but there are a few facts besides which must not be lost sight of. The Russian Empire imports more than 90 million pounds of tea annually and the great bulk is still furnished by China, whence it is imported at very low freights by returning vessels of the volunteer fleet despatched to the Far East with troops, convicts, railway material, and munitions of war. Then the duty on tea is 1*s.* 9*d.* a pound, and one may imagine what a premium and encouragement that constitutes to attempts to grow the precious herb in Russian territory. The tree trade freed from that crushing duty will be one of the bribes which Russia may offer to districts in China that she may succeed in annexing or bringing under her influence. Russian merchants at Shanghai in association with Chinese subjects have begun to introduce English made tea making machinery into China to favour Chinese at the expense of Indian tea. But apart from that there are districts on the western slopes of the Caucasus eminently fitted to the culture of the leaf. The climate, soil, and waterfall, the landscape on the railway journey from Batoum to Kutais remind one very forcibly of the Indian slopes of the Himalayas, and tea gardens are not wanted to complete the similitude. Mr. Popoff, of Moscow, who is to Russia what Lipton is to England, has 250 acres under tea flourishing and paying, the Imperial domains boast of 150 more, and the pioneer of the tea industry in the Caucasus, a retired engineer of the name of Slovitzoff, who began planting so far back as 1885, has some tea gardens in the Chakva valley, only seven miles from Batoum.

Labour is one of the difficulties in those regions, for the population is sparse and field hands are paid at the rate of 1*s.* 6*d.* a day, but cheaper labour could be imported from other districts, as we have done under still more unfavourable circumstances in Assam and the margin of 1*s.* 9*d.* a pound on duty-free tea will help to surmount that difficulty. Mr. Popoff has capital and enterprise: Chin gardeners were imported by him regardless of expense to start plantations, the Superintendent of the Imperial tea domains w until lately, an Englishman, and the best English tea machin will not be wanting in the Caucasus. Tea gardens, however, not made in one day, and, on the other hand, the samovar bubb in every homestead in the Muscovite Empire; the humblest Mou will have his tea—when he cannot get enough vodka—and it will many a long year yet before Russia, anxious as she may be to gr her own tea, can produce any appreciable quantity of the tea consumes, in Russia itself or in protected Chinese Provinces. Th years are the opportunity of Indian planters. If our teas o establish themselves in the favour of the people and on the mark of Russia, it will be afterwards difficult to oust them even b protected article. The voice of the consumer—of the Moujik in t instance—is the *Vox Dei* under the inexorable laws of supply a demand, and people will have what they like to eat and to dri even under despotic forms of Government. It is unfortunately deserved reproach on English producers and manufacturers th they do not adapt themselves readily to the taste of their custome and that reproach holds good against Indian planters as far teas for the Russian markets are concerned, but if Indian tea pla ers would only bestir themselves, we should not be long befor really marketable article would make its appearance from our Indi tea gardens to cheer and not inebriate the Muscovite.

TEA COMPANIES.

THE *Central Province (Ceylon) Tea Company, Limited.*—The follo ing is from the report of the directors:—The total crop from estates for the past season was 751,791 lb. against 713,330 lb. l year, being a substantial increase, though 30,000 lb. under estimate, chiefly owing to the abnormally dry season. The to sales, including bought tea, were 1,025,963 lb., averaging 5·85*d.* per The manufacturing business shows some improvement. The yi of cocoa was 492 cwt. against 507 cwt., but owing to the average pr being 62s. 3d. per cwt. against 54s. 2d. shows a larger pro Seventy-two acres have been cleared during the year, and there now 234 acres tea under three years' old. The Directors regret t the season's operations have not resulted more favourably. T profits have been affected by the higher rate of exchange, averagi 1s 3·96d per rupee, against 1s $3\frac{1}{8}$d last year, and also by the differe in price realised by the company's teas, which averaged as abo 5·85d per lb. against 6·35d last season. The net profits for the y amount to £4,099 0s 7d, which, with £1,351 12s 4d brought forw from last year, shows a sum of £5,450 12s 11d available for divisi Of this sum, £638 14s 9d has been written off for transfer duties, & and £1,500 has been applied to the payment of a dividend at the r of 6 per cent. per annum on the preference shares to Decemb 31st, 1897. The Directors now recommend a dividend at 6 per ce on the preference shares to June 30th, 1898, leaving a balance £1,811 18s 2d to be carried forward. It has been determined rebuild the factory at Weyweltalawa, at an estimated cost of abo R28,500, on a new site nearer the cart road, and the work is now progress. In view of this expenditure and the desirability of havi the interim dividend on the preference shares in hand, they ha deemed it necessary to write off the above-mentioned transfer dut in one sum, and to recommend no dividend on the ordinary share

Caledonian Tea Estates Company.—This Company is the succes to the Caledonian (Ceylon) Tea Plantations, Limited, which w formed in May, 1892. The Profit and Loss account to 30th Ju last, after providing for interest on Debentures (£40,000 at 5 p cent). London charges, Directors' Fees, &c., shows a balance credit of £2,268 14s. 1d. The Directors recommend the payment, of this amount, of a Dividend on the Preference shares (£32,0 issued) at the rate of 6 per cent. per annum, from the dates of p ment of the several instalments thereon to 30th June last, amounti to £1,133 12s. 8d , and a Dividend on the Ordinary shares (£35,0 issued of six shillings per share, amounting to £1,050. This pro for the Ordinary shareholdrs, taking into consideration the dates payment of the several instalments, works out at about $4\frac{1}{3}$ per ce The result of the first year's working falls short of the Origi Estimates, owing to causes which have affected returns from mo if not all, Tea Estates in Ceylon. The report discourses thus

Prices on application.

The season proved generally dry and abnormally cold, causing a serious shrinkage in yield throughout the tea-districts. This and the low prices prevailing have contributed almost entirely to bring about the comparatively disappointing result of the season's operations. This being the first year of the Company's business, and in view of the fact that part of the buildings and machinery are new, whilst a considerable sum has, during the year, been spent on upkeep and repairs and charged to current expenditure, the Directors have not thought it necessary to write off anything for depreciation. The estimates for the current year ending 30th June next, taking Exchange at 1s. 4½d., and the average price of the tea at 7d. per lb. net (which is below the present average) promise a satisfactory return on the ordinary shares, after providing for debenture interest, preference share dividend, London charges, etc., owing to the large area now beginning to come into bearing. The present statistical position of tea, together with the increasing demand for British-grown tea for foreign and colonial markets, justify the Directors in contemplating hopefully the future of the Company's business.

MARKET REPORT.

COFFEE.

Messrs. Wm. Jas. & Hy. Thompson's Report of the Colonial Markets for the Week ending November 23rd, 1898, states :—

This market has again been dull throughout the past week. Only a small part of the supplies catalogued have been sold, importers being firm. Good colory Guatemala met with a fair demand, but was held for ver full prices.

At the Dutch Sale held in Amsterdam on the 22nd inst., 20,504 bal Java and 48 bales Sumatra were offered, and sold at very irregular price good ordinary Java selling at 32½ cents, against 34 cents at the Octob sale.

Daily receipts averaged 7,100 bags in Rio and 14,500 bags in Santos.

Futures have fluctuated, and close quiet at 3d to 6d advance, viz :- Good average Santos in Havre, December delivery, fcs. 37.25, in Hambu pf. 31, and No. 7 low ordinary Rio in New York $5.35.

To-day's London official quotations are :—

	Nov.	Dec.	Mar., '99.	May.	July.	Sep
SANTOS ...	30/9	30/6	31/6	32/	32/3	32/

Auctions this week have gone off as follows :—

NYASSALAND.—17 bags bought in.

JAMAICA.—Of 83 barrels 3 bags offered a small part sold, good ordinary pale 33s to 35s, fine ordinary 40s.

COSTA RICA.—197 bags offered and 80 bags sold, ordinary brownish and dingy pale 30s to 34s.

GUATEMALA.—3,415 bags catalogued only about 650 sold, smalls 29s 6d to 37s, ordinary small and brown 32s to 34s, good ordinary dull pale 36s 6d to 37s, fine colory bold 92s, peaberry 100s; London-cleaned, smalls 32s, ordinary to fine ordinary 36s to 44s.

VERA PAZ.—348 bags nearly all sold, smalls 25s to 34s, ordinary brown 32s, good to fine ordinary brownish and pale 35s to 46s, peaberry 39s to 51s 6d.

VENEZUELAN.—470 bags bought in.

MEXICAN.—99 bags sold, triage 25s, ordinary pale 27s 6d, ordinary brownish 30s 6d to 34s.

COLOMBIAN.—1,351 bags offered and about 1,150 bags sold—small and ordinary pale 32s to 36s, good ordinary pale 37s 6d, fine to fine fine ordinary 46s to 56s, low middling gray 59s; London-cleaned, smalls 30s to 39s, damaged and soft greenish red 44s 6d to 54s 6d, low middling greenish 57s to 60s, middling colory greenish 62s to 68s, good middling to good 72s to 85s, peaberry 60s to 80s.

SALVADOR.—39 bags bought in.

BRAZIL.—Of 1,464 bags Santos only 30 bags small sold at 31s landed terms.

Receipts in Rio and Santos.

Since July 1	1898-9. Bags.	1897-8. Bags.	1896-7 Bags.	1895-6. Bags.
Rio.....	1 534,000	2,275,000	1,800.000	1,271,000
Santos.....	3,230,000	3,882,000	3,035,000	1,991,000
Total.....	4,764,000	6,157,000	4,835,000	3,262,000
Crop.....	—[illegible]	10,461,000	8,680,000	5,489,000

Exchange 8½d, previous day 8[illegible]d.

Closing report.—Auction supplies consisted of :—108 bags Jamaica, 55 bags South Sea, 156 bags Nyasaland, 919 bags Columbian, 1,925 bags Guatemala, 1,726 bags Salvador, 163 bags Mexican, 26 bags Bolivian, 485 bags Costa Rica, 148 bags Nicaragua, 203 bags Venezuela, 52 bags New Granada, 167 bags Coban, and 1,080 bags Vera Paz. A flat market and nearly all offered bought in. Good bids made for foxy greenish Guatemala —this the only feature.

COCOA.

Auctions on Tuesday were extremely slow, and of the large supply of 6,926 bags catalogued, only 800 bags sold at an irregular fall in value of 6d to 3s per cwt. 1,205 bags Trinidad offered, and 300 bags sold at 75s to 76s for fair to good red, and 69s 6d for ordinary dark. Of 375 bags Grenada 135 bags were placed at 6d to 1s decline—72s for good red, and 70s to 71s for common to fair. 34 bags St. Lucia partly sold at 65s to 66s, and 2 bags St. Vincent brought 68s. Of 112 bags Jamaica 15 bags realised 67s. 56 bags Demerara, 2 bags Dominica, 326 bags Venezuelan, 107 bags Tumaco, 269 bags Samana, 290 bags Colombian, 47 bags Domingo, 90 bags Bahia, and 414 bags African all retired unsold. Of 2,822 bags Guayaquil, 220 bags Caraquex sold at a fall of 3s, viz., 72s to 73s. 13 bags Seychelles partly found buyers at 60s 6d for defective and 66s for fair. Of 663 bags Ceylon, about 80 bags sold at 65s per cwt. Privately 100 bags Tenguel Guayaquil sold at 75s also some Caraquez at 75s, and after-crop Arriba at 73s; fine bright Ceylon sold at 79s per cwt.

Import, Home Consumption, Export and Stock of COCOA in London are as follows :—

TEA.

The *Record* of 25th ultimo says :—

CHINA.—There is very little enquiry for the better grades of Congous, but the lower qualities are in good request at occasionally some improvement in prices. At auction 8,473 packages have been catalogued during the week and a fair proportion of the Congous sold at firm rates, but Scented Capers were generally bought in, holders' ideas being too high, whilst Green was cheaper.

INDIAN.—Rather heavier sales were held, comprising 48,100 packages *versus* 46,800 packages for the corresponding period of 1897.

There was a fair demand for all useful liquoring parcels, but where Garden invoices showed a falling off in quality as compared with former arrivals, there was less disposition to purchase and quotations were often lower. Common and undesirable kinds, particularly in Calcutta-bought shipments, were somewhat neglected and many lots were withdrawn, owing to offers being under limits. Judging from the daily duty payments, consumption is going on favourably, and the statistical position when the monthly returns are issued promises to be satisfactory.

For 34,100 packages on Estate Account 8½d was realised, against 8¾ per lb. for 24,700 packages and 8½d per lb. for 34,000 packages in the two foregoing seasons.

Including catalogues for Monday, the 28th inst., 197,700 of this season's growth have been printed, which will bring the quantity disposed of to about 67,000,000 lb., contrasted with 212,000 packages in November of the preceding year, and 66,000,000 lb. sold to the end of that month.

CEYLON.—Public auctions embraced 21,200 packages opposed to 18,300 packages on the 15th inst., and 9,700 packages in 1897.

Pekoe Souchongs and Pekoes again met with good enquiry and passed firmly, a fractional advance being occasionally recorded notwithstanding the temporary curtailment of orders from abroad. Ordinary to medium Brokes Pekoes were taken up at steady rates but fine and finest which were sparsely represented, continued to mark considerable irregularity in value though no further decline was established.

Owing to the smaller proportion of fine tea the average has fallen to 8⅜d per lb. On the 17th inst. it stood at 8½d per lb., and 8¾d per lb. on the 25th November, 1897.

JAVA.—Only 540 packages of direct import were brought forward which went off with spirit without material alteration.

About 1,500 packages are declared for the 1st proximo.

Deliveries.

The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns, were:

From 1st to 22nd Nov., 1898.....13,856,660 lb.
" " 1897.....12,144,057 "

During the week the following have been printed for sale by public uction:—

	Sold. Pkgs.	Withdrawn. Pkgs.	Total offered. Pkgs.
India	40,306	7,837	48,143
Ceylon	20,057	1,109	21,166
Java	320	220	540
Total	60,583	9,166	69,849

Also 520 packages from second hands.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated November 25th, 1898, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1898-1899.	781.357 pkgs.	590,259 pkgs.	21,996 pkgs.
1897-1898.	762,654 "	605,715 "	21,372 "

48.515 pkgs. Indian
21,377 " Ceylon
540 " Java.
} Total 70 432 packages were offered in public auction this week.

Foreign and Colonial markets for British Grown Tea continue to expand with a steadiness which augurs well for the further development of this necessary outlet for the produce of India and Ceylon.

1898.	1897.	1896.	1895.	1894.
lbs. 42,918,654.	34.859,215.	28,250,961.	25,002,230.	20,905,531.

The quantity taken in the first nine months of 1898 was more than double that of 1894;—only four years ago; and the present year has already witnessed a most important increase in markets which are capable of absorbing very large quantities, when once the taste has been fully established.

EXPORTS of INDIAN and CEYLON TEA (in lbs.) to places outside the United Kingdom from 1st January to 30th September.

INDIAN.	1898.	1897.	1896.	189
Re-exports from U. K. ...	5,095,095	3,758,006	2,461,673	2,760,6

Total lb. ...	26,914,107	20,800,934	16,441,567	14,691,1

It is satisfactory to record a steady increase in consumption at home co currently with expansion abroad.

Indian. No material change has taken place in the market; mediu Teas with useful liquor continue to attract more attention, while the bi ding for commonest grades has not been quite as keen as a few wee since. Averages worthy of note:—"Beheating," 1/7¼ "Poobong," 1/3.

Ceylon. Bidding was mainly concentrated upon the lower grad everything up to about 7d. showing a strong market. Better descriptio met with a trifle more attention than last week. The following averag may be mentioned:—"S.T. Co., St. Leonards," 1/0½; "Dimbula Vall Co. Lippakelle," 11¾. Average for the week 8·23d., against 8·50d. sa period 1897.

Ceylon Tea sold on Garden Account 1st Jan. to date 1898, 1,013,711 pkg av. 7·72d. 1897, 979,425 pkgs., av. 7·77d.

	1898.	1897.	1896.	189

IN AUSTRALIA.

SYDNEY, *November 21st.*—A considerable business has been done in Panyongs—a good export demand being diverted to this centre by the imposition of the 3d. duty in Sydney. Sales of 2,500 packages at 5½d. to 5¾d. for original weight common teas, 5¾d. to 6d. for light weight do., and to 7¾d. for finer qualities; a good demand. The Australian brings the last shipment from Foo Chow, bringing the total for the season up to 5,750,000lb. Indian firm and the Calcutta market has again advanced.

To-morrow Messrs. Henry Harris & Co. will offer a catalogue of 1,152 packages of teas, comprising 702 Ceylons and 450 Indians on account of Messrs. Gerber, Michaut & Co., Smith, Findlay & Co., H. J. Langdon & Co., and the Ceylon and Indian Tea Shippers' Associations.

MELBOURNE, *November 19th.*—A moderate business has been done to-day, comprising 300 half-chests panyong at 5½d., 200 quarter-chests buds at 6d., 200 quarter-chests S.O. pekoe at 7d., 30 chests Assam at 6½d., and 80 packages Ceylon at up to 7½d. On December 6th, Messrs. Fraser and Co. will offer 1,274 packages Indian on account of Messrs. Jas. Henty and Co.

ADELAIDE, *November 19th.*—In tea, there is fair volume of distributing trade doing, but nothing of special moment.—*Australian papers.*

PEPPER.

Black.—The market is steady for parcels on the spot, but is lower f arrival. About 150 tons have been sold, including fair Singapore on t spot at 4⅞d to 4 13/16d, October-December shipment at 4 13/16d, January-Mar at 5d to 5 1/32d.

At auction on Wednesday 244 bags Singapore were bought in at 4⅞ also 400 bags Tellicherry at 4¾d per lb.

White is quiet. Singapore on the spot has been done at 8 1/16d a January-March shipment at 8⅛d; Penang on the spot at 7½d to 7 9/16 November-January 7 9/16d, January-March at 7 13/16d to 7¾d, and Februar April at 7 13/16d per lb. Sales 100 tons.

At public sale on the 23rd inst., 392 bags Singapore, 81 bags Siam, a 164 bags Penang all passed the hammer unsold, except 20 bags good of t last-named description which sold at 7⅛d per lb. short prompt.

Sweet Red.—8 cases Spanish retired at 90s per cwt.

GINGER.

Cochin.—There is very little doing in this article, but cut B's so "without reserve" at higher prices. Catalogues comprised 443 bags 5 cases, of which 40 bags 52 cases sold—B cut, plump but rather small, 6 to 61s 6d, small to boldish hard rough 22s to 22s 6d per cwt.

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Sin gle Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N. B.—Remittances should be sent to E. C. Duft & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

NOTICE.

In consequence of the Christmas Holidays there will be no issue of *Planting Opinion* next Saturday. We take this opportunity, therefore, to wish all our readers both a Happy Christmas and a Prosperous New Year.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 30th December, 1898.

Season Reports should be sent to the Printers, Messrs. Addison & Co., direct, and not to *Planting Opinion* Office.

Coorg.

Polli Betta, 21*st Dec.*—*Weather.*—Cool, bright and Eastwindy the greater part of last week, cloudy one evening. Ditto yesterday and to-day, but don't fancy it portends rain. A small shower would perhaps assist trees to ripen crop, but heavy or continuous rain is to be deprecated. *Crops.*—Contract picking nearly everywhere; apprehensions of water running short owing to lateness of crop. Crops turning out well. *Plant-diseases.*—Leaf-disease in a milder form still about; trees looking well considering the crop on them; promise for next season good.

PLANT LIFE—ITS FRIENDS AND FOES.

In the world of human beings there are both carnivorous feeders and vegetarians, and if the comparative weakness of the latter prevents them from preying on the former to the same extent as they are preyed upon in turn, both at least follow the maxim of "every man for himself." In the world of animals, the carnivorous feeder preys even more openly upon the vegetarian, though he may occasionally be vanquished in the struggle. In the worlds of birds and insects again, we find the same broad general division of classes, and here again the tendency is for the flesh-eaters to make and to hold the position of conquerors, and for the vegetable-eaters to be the subjugated, where subjugation usually means death. In all four worlds there are doubtless those also who eat both flesh and vegetables, according

to taste or circumstances. But the general principle that the carnivorous prey upon the vegetarian is one that has been long recognized by agriculturists, among others, and that has been utilized very largely for the extinction of predatory birds and insects. When a man finds his coffee suffering from the ravages of a fungus or a bug, it is no time to preach to him about "blessings in disguise." His inclination is to exterminate the depredator. His crops fall short, and perhaps suffer in quality as well as quantity. Tell him that this must react upon prices, and thus eventually restore the balance: and he will probably reflect that by the time this reaction sets in there may be no balance at his bankers' capable of restoration. Yet, for all this, in studying the question of foes to plant life, and foes of these foes, we must not overlook the fact that pests, as well as droughts and floods, may at times serve a very useful purpose. They may, in effect, tend to check the evils of over-production just as disease among human beings tends to check the evils of over-population. We must be prepared to accept many apparent evils as dispensations of an all-wise Providence. But the disposition of most men is to view very philosophically the evils that fall upon their competitors or even at times their neighbours, and by no means calmly or with resignation upon such as befall themselves.

Writing, as we now do, with more especial reference to the producing interests of Southern India, concerning Rice, Sugar, Oilseeds, Tea, Coffee, &c., we must remark at the outset that short-production of several of these commodities can in no case be a real benefit to India. As regards Rice, it can scarcely benefit any one, for who can suppose that a falling off in South Indian crops affects prices generally throughout the world? On the other hand, a sudden disaster to Brazilian coffee crops, or American or Russian wheat, or to many other articles, does immediately find a counterpoise in a rise in prices in many countries. This, therefore, is a point of some importance when men attempt to tamper with the works, and regulate the speed or force of nature's machinery, to suit their own convenience. It is a point that should be always kept in view where efforts are made to exterminate plant or fruit pests or to eradicate plant diseases. Care must be taken, too, to see that previously unknown evils of great magnitude are not substituted for known evils of lesser importance. For instance, the pest that preys upon coffee is in turn eaten by lady-birds, they are pursued by certain birds, and these by other birds and animals, and so on. When man steps in and weakens or strengthens one link, or more, in the chain, he can never be quite sure of what the eventual result will be. It has been well said that in an entirely normal state of nature the relations between plant-feeding insects and their enemies remain practically the same during a series of years. Some predaceous animals and insects prey indiscriminately upon various plants. Others confine their attention to a particular species or a few closely allied species. Hence, in the latter case, the abundance of a particular species of insects is greatly influenced by the abundance of those enemies. If, however, its enemies keep an injurious insect in an almost complete state of subjection, one result is that they become too numerous; that they run short of food and perish for want of it; and the survivors among its pests are left free to breed and multiply again, and have a good time with the plants they love. A fresh reaction sets in later, and so the pendulum swings betwe seasons of abundance and scarcity, of victory and defe of life and death.

Now this rise and fall of particular insect "nation takes in some instances but a season, in others several yea The general principle noticeable, however, is that nat tends to preserve a balance, and under strictly natu conditions no insect long remains superabundant. In t connection "natural conditions" mean wild growth. Now days modern artificial conditions predominate. This hu area has been set apart for the cultivation of coffee, that tea; one for rice, another for the sugar-cane. The pla are cared for, made more tender, more succulent. The pla feeding insect is a highly appreciative consumer. Intend to live as a species of insect Bedouin, picking a liveliho up in the desert, fighting for his food and his life, finds himself in a bed of clover, tenderly cared f with rich food provided without any trouble on his pa What would happen to the human Bedouin under simi conditions, happens to the pest of plant life. He enjoys su an excellent time that he becomes bloated and unhealth The day will eventually come when some enemy will r against him and wreak a revenge for past wrongs, a insults and impositions. But that time may be lo deferred, or may come soon. If man is his enemy, the will certainly be a vigorous attempt to put him un subjection without delay; and thus it is that insects are, to speak, artificially bred and trained to prey on insec in the interests of man. There can be no doubt that ve many useful operations of this kind have been conduct and that scientific investigation has rendered great serv to cultivators. At the same time, we think that m planters in Southern India will agree with us in our opini that the use of predaceous insects should be a seconda remedy. As a general rule, the primary object of t planter should be to give his plants liberal and healthy nut tion; to select good strains of seed, and really stro and healthy specimens of those strains; to cultivate plants according to natural conditions, and so to build a strong and hardy stock capable of successfully resisti the attacks of ordinary foes. When extraordinary fo come, extraordinary methods must be resorted to, and it at such times that we hear of the necessity for special lab birds, &c., &c. We are very far from opposing spec methods such as these. Our contention is simply that t chief safeguard against foes and disease is the streng that springs from perfect health. Hence, it is the health plant life that should be the cultivator's chief care.

AN OLD FRIEND UNDER A NEW NAME.

THE *Ceylon Observer* has got things a bit mixed. says:—"Mr. Newton—a well-known planter of some twel years' standing in Southern India—is now in Colom to go on by the Orient s.s. 'Orizaba' to Sydney *route* to Queensland, where he has got an appointme in the Government Agricultural Department. Mr. Newt is an Entomologist, and his name came prominently befo the public in connection with the experiment in impo ing lady-birds from Queensland to benefit the coffee Mysore, Coorg, &c., by eating up the bug and oth insect pests. The experiment was not a successful ou

inasmuch as the beetles died on the way. It took Mr. Koebele some time to perfect the arrangements by which he was eventually successful in transporting the lady-birds to Hawaii and California. Very possibly, while in Queensland, Mr. Newton may be able to help the planters of India (and Ceylon) interested in coffee, if they decide to make another attempt to import the little enemy of the coccus-bug. It is not unlikely that the Queensland authorities have engaged Mr. Newton to advise about the infant coffee planting enterprise in their Northern territories in the Cairns and Mackay districts. Mr. Newton retains his membership in the United Planters' Association of S. India, and is likely to be enrolled as a member of the P. A. of Ceylon as well."

From first to last this is excellent. Mr. Howard O. Newport as "Mr. Newton;" he "retains his membership in the U.P.A.S.I.!" Truly, our planting friend in Colombo is getting behind the times. There is very little reason to doubt that Mr. Newport proceeds to Queensland as a Coffee expert, and we wish him great good luck. It was entirely due to his own diffidence or modesty that we did not announce his appointment when the news of it first reached us—a couple of months ago.

PARA OR CASTILLOA RUBBER SEED.

THE Secretary to the Government of Madras having asked the Colonial Secretary, Straits Settlements, for information as to the feasibility of importing genuine Para or Castilloa rubber seed from Singapore, the cost and the best mode of transport, the latter official replied that the Director of Forests, Straits Settlements, reported that there is no doubt that properly packed Para rubber seeds would retain their vitality until they reached the Anamalai Hills, provided there was no delay in transit. He added, however:—"As there is no other place in Singapore except the Botanic Gardens whence these seeds can be supplied, and as orders have been obtained from planters in these parts which comprise all the available stock for the next three years, it is evident that planters in Madras cannot look to Singapore as a source of supply in any quantity. In connection with this the Director of Gardens points out that Ceylon would be a more suitable place from which to obtain a supply of seeds than here, as in the first place it is nearer, and in the second place the trees from which the seed would be gathered would in all probability grow under conditions more similar to Madras than here. No seeds of Castilloa are obtainable here. The cost of Para seeds would be $1 per 100, excluding freight, &c."

Almost at the same time as the above reached us came Messrs. J. P. William & Bros' (Veyangoda, Ceylon) New Product Circular No. 32 on the subject of *Castilloa Elastica*, "the most valuable Central American Rubber Tea." The circular states that this Central American rubber tree thrives from the sea-level up to 3,500 feet, inundated places should be avoided, shelter required in strong windy situations, it grows to about 60 feet in height, cattle attack the young plants, ripe seeds are devoured by birds, the outer skin is sweet, all the trees do not bear seeds, and seed bearers do not exceed 10%, although all the trees flower twice a year, seeds cannot be expected yearly as crop fails. A sample of Castilloa Rubber from Ceylon grown trees has been valued in London at 2*s.* 6*d.* to 2*s.* 9*d.* per lb. in 1893. Trees tapped in the wet season are said to yield five times as much milk as in the dry. Instructions are given for raising and planting out plants, and on certain figures given by Mr. Hart, F.L.S., of the Botanical Gardens, Trinidad, it is estimated that a plantation of 500 acres would yield in eight years the enormous profit of £44,337 10*s.*, and the yield increases every year with no outlay except for weeding and harvesting.

INDIGENOUS LADYBIRDS.

IN view of the suggestion that indigenous *Coccinellidæ* should be collected in India, it is interesting to note the experience of Guatemala coffee-planters. In the Consular report for 1897 it is stated that toward the end of 1896 and throughout 1897 planters in the Alta Vera Paz district were much alarmed by the appearance among the shrubs of a destructive bug generally called the "chinche." These bugs were described as a kind of coffee phylloxera, except that they attack the branches and entire plants above soil rather than the roots. Many methods were suggested for destroying the insects, and one of the most favored plans was the introduction of other insects which prey upon the "chinche." Several specimens of the lady-bird were imported from California, whither they had been taken from Australia. The method of transportation is not stated, but we read:—"these insects were procured at considerable expense." The Consul-General of Guatemala in San Francisco was instructed to contract for the purchase of a quantity of these ladybirds, but the price demanded was so high that it was found impossible to prosecute this method. The Consul-General expressed the opinion that the proposed purchase was not only undesirable on account of the expense, but also unnecessary, as the same insects were indigenous to Central America, and were found in various parts of Guatemala, where they were known under the name of "tortolitas." An expert was accordingly appointed to examine into these questions, with the result that it was finally decided that the "tortolitas" were not in all respects the same as the ladybirds—which particular species of ladybirds was referred to is not stated—but that they did destroy the "chinche," which, after all, was the main point. It was also noticed that the "chinche" was generally accompanied by a fungus which destroyed it. So the importation of ladybirds from abroad was unnecessary. The British Consul observes that in conversation with one or two coffee-planters in the Escuintla district, he found that the "chinche" had made its appearance there also. The "tortolitas," however, were found fairly efficacious in destroying the other bugs, and what at first appeared a serious matter, is now regarded as giving cause for but little apprehension.

The hackneyed phrase "*et de te fabula narratur*" springs to the point of the pen as the above story is concluded. A word or two changed here and there, and we have a story that is probably applicable in regard to South India. At any rate, the above statements are suggestive, and clearly indicate that the U.P.A.S.I. is on the right tack, now that it is bent upon discovering the indigenous natural enemy or enemies of the abominable green bug.

COFFEE IN DISTANT LANDS.

I.

PRECISE information concerning the cultivation of Coffee in many of the less important producing countries cannot be obtained. Still, a few rough notes, the outcome of inquiries made through consular channels, may be of interest to planters in Southern India. If any of them can add to the information we now give, whether concerning one of the countries mentioned or some other not in our list, we shall be grateful.

Costa Rica.—Coffee is the staple article of cultivation, but no official reports or papers on its cultivation have ever been published there. Indeed, we learn that there is no recognized rule as to the best system of cultivation, but on the contrary a great variety of opinion among planters as to methods. The systems adopted with regard to shade, pruning, &c., differ considerably, and are, as is natural, influenced by the altitude and nature of the ground, and the age of the coffee.

Fiji.—Coffee-planting was started in this Colony about twenty years ago, but after a few years disease practically swept the European plantations out of existence. Lately, however, fresh attempts have been made with Liberian in a small way. The results are said to look promising. The Natives also have lately planted both Liberian and Arabian, so there may be more to tell about Coffee in Fiji a year or two hence.

Hawaii.—The export of coffee is small as yet—only 337,158 lbs. last year,—but last year doubled the year before; and it is proposed to appoint, at Government expense, a commission of experts to promote a knowledge of the best methods of cultivation, to watch markets, and so on. All this looks like business.

Madagascar.—Some years ago the Coffee trees planted in this island, especially on the East Coast, were devastated by *Hemeleia vastatrix*. For the last four or five years, however, coffee-planting has been having another try on the Coast, Liberian having been planted fairly extensively. This is found to be hardier than the Arabica, of which there are still trees in the central parts of Madagascar, in Imerina especially, in secluded places, shut in from the winds, especially the east wind, and generally close to villages, where they thrive pretty well and are kept up by all the dirt and refuse of the village. It is questionable whether Coffee would pay on a large scale, for the lands of the central parts of Madagascar are far from being fertile, and Manure is indispensable for the success of any agricultural undertaking there.

The Liberian is the Coffee fittest for the East Coast: it grows in almost all kinds of soil, and does not require manure and shade. The tree bears at the end of the fifth year.

However, Madagascar has to *import* Coffee, and is not likely to be able to meet her own requirements with her own production for many years.

Panama.—Cultivation only in an incipient stage, little or none exported.

Porto Rico.—Coffee is grown, but few details have yet come to hand, except that it forms the largest export, and is of a very high-class. About 90% of it is sent to Cuba, Spain and France. The cost of production is comparatively high, and considerable capital is required by the planter.

GOVERNMENT AND PLANTER IN CEYLON.

WHEN Sir West Ridgeway lately alluded to the planti industry in his opening speech in the Legislative Counc he gave an opening to planters of which they were n slow to avail themselves. He evidently wishes it to understood that he did this advisedly—we were nea writing "of malice prepense"—for he now states that thinks he went further than any other Governor in maki the admission that they might at sometime or other cla a reduction of railway rates if they proved three poin viz., that tea was in urgent need of relief; that the rel should take the form of a reduction of railway rates; a that the reduction of railway rates would assist the estat most in want of relief. Following this up, a deputation planters waited upon His Excellency on the 12th insta and submitted a Memorandum and a Statement, expressi the opinion of the Committee that certain reductions in t railway tariff on tea were necessary and should be press for. It was stated that the position of tea is in some re pects critical, and that economy and reduction of expen ture are necessary, wherever practicable. It was assert by one of the planters who spoke in support of t statement, that every planter can testify to cost of p duction having been reduced to the lowest level within t *planter's* control, short of starving estates, and that plante can also speak to diminished prices and reduced profi Now, they want a reduction in rail rates, just as th want a reduction in certain home charges. The Govern put some very pertinent questions with a view to eliciti precise information, and while speaking sympathetica naturally declined to make any offhand promises. Plante had touched upon the surplus shown by railway revenu which indeed seems to account for more than the wh surplus shown in the Colony's annual accounts. Sir We Ridgeway inquired somewhat suggestively whether t question of the urgency of relief for tea would have aris had there been no surplus! On the other hand, plante argued that without tea there would have been no surplu and, in short, their whole representation was to the effe that tea constitutes the State in Ceylon, and that as good times the estate supports the State, so in bad tim the State must come to the assistance of the estate. It a very pretty line of argument. One can hardly say h much the aid claimed means to each individual planter, per acre. Mr. Law said that to the people at Hatton it mea about Rs.5 per ton, to him personally something li Rs.400 per annum. The Governor consequently thoug that there was no real *urgency* about the matter, seei that the relief planters would gain would be so small. it is probable that planters will have to wait a little, pen ing the report of the Commission that is inquiring into t incidence of taxation.

It is perfectly open to His Excellency to argue that t cost of production of Tea in Ceylon has *not* been reduc to a minimum, seeing how much money various estat annually contribute in the shape of the Tea Cess. He mig reasonably say that planters should openly ask Governme to bear the cost of advertising Ceylon Tea abroad rath than reduce rail rates. But he no doubt sees that, matter how the application is worded, Ceylon planters a in effect applying for a bounty from the State. *Th* make it, and it cannot do otherwise than help them. We

not blame planters for taking this line, nor do we even object to their succeeding in getting what is wanted. At the same time, we cannot but feel that that industry is in danger, whose chief representatives feel compelled to rely on artificial measures of support. We see a Ceylon contemporary rejoicing because the anticipated import duty on tea in Canada will give India and Ceylon an advantage over China and Japan; we see planters asking for a reduction of rail rates without attempting to show that Tea is charged unduly high freights as compared with other articles. Yet these are the very men who complain bitterly of the artificiality of exchange. They are neither consistent nor logical in their reasoning; and when the Governor said their troubles were due to high exchange, he showed a wider appreciation of the truth than those who were trying to get an artificial incubus lightened by means of the introduction of artificial props. It is a pity, we think, that our neighbours did not concentrate all their energies on the currency war, and reserve the question of reduction of the railway tariff until the future currency policy of the authorities had been decided upon.

NOTES.

The Reduction of Crop. Mr. A. Cooke ("Sirocco") now wants planters in the North to occupy themselves during their "silly season" by considering what he thinks to be the most important of all questions, viz., the means of reducing the crop of tea!

The Calcutta Tea Sales. The average price realised at the sales of the 9th instant was 5as. 4 pies. About 14,000 were offered on the 16th instant. The market was firm for all descriptions, and Souchongs showed a rise of from 1 to 2 pies.

Soil Analysis Free. With reference to what we wrote last week, Mr. A. Baur, of the Ceylon Manure Works, informs us that he undertakes to execute soil analysis free of charge for both Ceylon and South Indian planters whenever a trial is made with his Fertilisers.

The Colombo Tea Sales. At the public sale at Colombo on the 14th instant, about 11,126 packages=871,300 lb. were offered, and about 8,432 packages=661,150 lb. sold. The tone was irregular, prices much the same as the previous week, except for common and medium Broken Tea, which were slightly easier.

To South Indian Planters. See to it that the following words of a British Consul do not become applicable to you as well as to British merchants:—"British firms nowadays seem to expect to have markets found for them instead of finding them for themselves as in the past."

The Life Plant. There is a plant in Jamaica called the life plant, because it is almost impossible to kill it, or any portion of it. When a leaf is cut off and hung up by a string, it sends out white, thread-like roots, gathers moisture from the air, and begins to grow new leaves.

Coffee in Queensland. It appears that there are only about 311 acres of land under Coffee in Queensland, but that many inquiries from over-sea have been made concerning land suitable for coffee-growing at Mackay and in other parts of tropical Queensland. There were also people at Mackay lately on the look out for coffee-lands, and it is confidently expected that before long the neighbourhood will be a great district for the cultivation of coffee.

Tea. *Capital* remarks:—We observe that a meeting has been called to wind up the Central Terai Tea Co., and we hear that the Mattigurrah Tea Estate was sold by auction on Tuesday for Rs.3,300. Tea gardens are evidently going cheap. We hear that about forty gardens cannot get their outlay so far financed; the banks, we think, are very wisely limiting their liabilities in this direction.

The London Tea Market. Cabling to Colombo on the 15th instant, Messrs. Gow, Wilson and Stanton reported that the market generally was unchanged. The price of Pekoe Souchong was unchanged at 6½*d.*, the average a farthing down=8*d.* Reuter reported that Ceylon Teas were firm at previous rates, but his average—8⅛*d.*—showed a drop of ⅛*d.* Of 21,000 packages offered, 19,000 were sold. On the other hand the average of Indian Tea—8⅜*d.*—showed a rise of ⅛*d.* and 31,000 packages were sold out of 35,000 offered.

Cacao Crop Estimates. The Northern Planters' Association of Ceylon has resolved:—"That the Parent Association be asked to adopt measures to obtain information from other countries regarding the present acreage and extensions of cacao and other low-country products, their cultivation, diseases and blights known, estimates of crop, etc., from the Consuls, Chambers of Commerce, and Agricultural Societies in their respective countries; and to ask that a permanent Cacao Sub-Committee of the Association be appointed."

Thanks to the Blenders! A visitor to England, after an absence of some years, makes the following remarks as the result of his observations in regard to the taste for tea in the old country:—"One thing I have to note. It is observed that the taste of tea has much deteriorated in England notwithstanding the enormous quantities consumed and all the facilities for obtaining good teas. To whom do we owe such state of things? To the 'Blenders'! It is a problem in many households where to go to find good tea, and that is a remark I heard set forth by many people." This raises once more the question of the ousting of the middleman.

Cacao in Samoa. The cultivation of Cocoa in Samoa is an accomplished fact now, and Cocoa is taking the place of Coffee in the islands, and is thought to have a future before it. A great deal has been planted in and around Apia as well as in more distant parts of the group, and the growers confidently predict that this crop will prove to be the staple export of Samoa. Several tons have been exported already, and heavy crops are being produced. It is estimated that not less than 75 acres of

land are planted with cacao now in bearing; and no "enemies" have yet made their appearance.

Coffee in October. Movements were lighter than usual this year, especially in the United States. This, as the *American Grocer* remarks, seems to be confirmatory of statements made during the consideration of the proposed tax on coffee—that a large quantity of coffee was withdrawn from licensed warehouses in anticipation of the tax, and that dealers everywhere carried unusually heavy stocks. The world's total visible supply on November 1 was the largest on record, and about equal to one-half of the world's maximum production in one year. However, the receipts at Rio and Santos for the first four months of the present crop year were 4,264,000 bags, which is 1,074,000 bags less than in the like period of 1897.

Close Plucking. The East Cachar correspondent of the *Planter* has the following sensible remarks on this subject. He says :—"There is, or ought to be, no rule of thumb in such matters, and what suits Darjiling may not suit the Duars, what pays South Sylhet may not pay Upper Assam. Even on gardens in the same district it may be unadvisable to have an identical style of plucking, manufacture, and general working. As regards close or fine plucking,—although . . . . . the two terms are not synonymous—it must never be forgotten that the great bulk of our teas are consumed by the British lower classes and lower middle classes : the palates of those are not very refined; and even granted the same price, they would as soon drink Cachar Broken mixed as Darjiling Orange Pekoe. But the question of price is to them a very important matter."

The Depression in Tea. A Calcutta correspondent records as showing the extent of the depression in the tea industry, a certain sale of a tea estate. On the 13th instant Messrs. Mackenzie, Lyall and Co., under the order of the proprietors, sold by public auction, without reserve, the valuable tea estate known as the Mattigurrah Tea Estate, as a going concern as from the 1st January next. The estate, which is situated below Darjiling, comprises an area of about 570 acres, of which about 346 acres are under tea cultivation, held under a renewable Government *pottahs*. The outturn for the past season was 93,292 lb., and the estimated outturn for the current season is 120,000 lb. The bidding started at Rs.1,000, and gradually rose to Rs.3,300, at which low figure the estate was knocked down to Mr. Smallwood, of Messrs. Davenport and Co., Calcutta. The number of bidders was very small.

"The Enterprising Grocer." The *Daily Mail* is responsible for publishing a letter in which quite a new phase of the "given away with a pound of tea" movement is recorded. The story refers to a *West-end* grocer's, where a customer was informed by the young lady behind the counter that if the purchase (of Tea) were made up to a pound weight, the customer "could step into the parlour and have a tooth drawn free of expense." A new field of enterprise, indeed. Not only for the grocer but for the comic press. It opens out wide fields for speculative and philosophic thought, and wh continents for the advertiser: "Our new blend: Pain wi Pleasure neatly blended." "Toothsome Tea and no Toot ache." "Our new Tea can be conscientiously reco mended to all but the Toothless!" and so on. If t Co-operative Coffee-planter can but go one better, the may be a hope of success even for co-operation in retail.

Green Bug in Coffee and its Cure. A correspondent sends the *Ceyl Observer* an extract from "D Echo" (translated from the Germa giving a cure for the green bug :—"According to a pre minary report, Professor A. Zimmerman, of the Botan cal Garden of Buitenzorg, has discovered upon the gre bugs of the coffee a fungus which causes their epidemic death. This fungus is easily cultivated upon the pla Ogar-Ogar so as to obtain a sufficient quantity of spor to propagate the infection on a large scale. Profess Zimmerman recommends to touch the bugs with a bru which has been dipped in the culture of the fungus la in the afternoon on plants which are out of the sun's ray After four days the new growth can be seen with t naked eye." It is to the interest of coffee planters of oth countries to study this fungus which they can procure fro Buitenzorg. This is another instance of the importance scientific investigation.

Tea and Coffee. The *Medical Times* observes:—Te and Coffee seem to be much alike many respects, but the latter is generally preferable as to i sustaining power. It would be a great advantage to o working classes, and a great help toward the furth development of social sobriety, if coffee were to come in greatly increased use, and if the ability to make it we could be acquired. As an example of the difference of th effect of tea and coffee upon the nerves, the writer not that it is far better to drink coffee than tea when shootin Tea, if strong or in any quantity, especially if the individu be not in very robust health, will induce a sort of nervou ness which is very prejudicial to steady shooting. Und its influence one is apt to shoot too quickly, where coffee steadies the hand and gives quiet nerves. All th is true, no doubt, but Coffee has its disadvantages als Many people find it too heating and too stimulating, whi on the other hand the sustaining powers of Tea are n done justice to in the remarks of our medical contemporar

The Canadian Preferential Tariff. Some curious facts have bee mentioned in regard to the effe of the preferential tariff upon th import of dry goods into Canada. It appears that for th three months ended September, 1897, the imports amounte to $5,5917,305, for the corresponding period of 1898

$7,904,129, an increase of nearly $2,500,000, or over 40°/ . On the other hand imports of articles on the free list—including Coffee and Tea—showed a total decrease of nearly $1,000,000, or nearly 40°/₀ ! It is to be hoped that Tea (and Coffee) will now find salvation in the duty that is expected to be imposed. By the way, commenting on the probability that the Dominion Parliament will impose a 5 cent duty on Tea, which will give Indian and Ceylon Teas an advantage of something like $\frac{5}{8}d.$ per lb. over foreign sorts, the *Times of Ceylon* remarks:—"Subject to the condition that an equivalent tax is intended on coffee—which if not proposed should be vigorously petitioned for by the P. A. and the local Government—we welcome the new tax." In fact, our contemporary regards it as meaning "the beginning of the end for China and Japan teas in Canada."

"Lantana," Limited.

To Mr. John Cameron, the Superintendent of the Mysore Government Gardens, is due the establishment of this concern in Bangalore. It is incorporated under a by-law of the Bangalore City Municipality providing that the growth of Lantana within Municipal limits shall be kept under control. Mr. Cameron drew attention over a year ago to the extensive growth of *Lantana Camara* in Mysore, and observed that while the shrub served a useful purpose if kept in its proper place, it should only be admitted with much caution and to a very limited extent where the soil is already fertile. It is a hardy plant, and its seeds are spread far and wide by birds. Like the prickly-pear, too, it takes a good deal to fairly eradicate it. An attractive and protective plant, it makes a good bid for popularity, but the fiat has gone forth, and for the future its growth is to be limited in Bangalore. No doubt similar measures will probably be taken in other parts of Mysore, so that we may expect soon to see "Lantana, Limited," opening numerous branches and throwing out "suckers and seedlings" as vigorously as the plant itself does.

Spencer and Company, Limited.

In submitting to the ordinary shareholders their report upon the working of the business for the year ended 30th June, 1898, the Directors have much pleasure in reporting that there has been a steady improvement in the returns of every Branch of the business with the exception of the Bangalore Branch, where, owing to the removal in August, 1897, of the troops from the station in consequence of the late war on the North-West Frontier, there has been a reduction in the volume of business. The net results, however, of the whole business show a very satisfactory increase in sales. The result of the year's working shows that, after making a full allowance for depreciation on buildings and on furniture and plant, after writing off one-fifth of the preliminary expenditure, and after providing an ample reserve for bad and doubtful debts, there is a net divisible profit of Rs.3,31,784-4-7. The following payments have been made out of this sum in respect of dividends on the Preference and Ordinary Shares—

	Rs.	A.	P.
3 °/₀ on the Preference Shares for the half-year to 31st December, 1897, paid on 17th January, 1898 ...	20,518	10	9
3 °/₀ on the Preference Shares for the half-year to 30th June, 1898, paid on 16th July, 1898	29,724	11	9
Paid to Preference Shareholders...	50,243	6	6
5 °/₀ Interim dividend on the Ordinary Shares for the year, paid on 16th July, 1898	75,000	0	0
Divided...	1,25,243	6	6
leaving still available for division	2,06,540	14	1
	3,31,784	4	7

Out of this the Directors propose to pay a further dividend of 5 °/₀ on the Ordinary Shares, absorbing Rs.75,000 (making a total division of 10 °/₀ on this class of shares), leaving Rs.1,31,540-14-1 still to be dealt with. The Directors suggest that a bonus of one month's salary be granted to all the employés of the Company who have served during the whole year, amounting to Rs.13,150-0-0 and leaving a balance of Rs.1,18,390-14-1 to be carried forward to next year. As the whole of the Preference Share Capital was fully paid up prior to the 30th June last, the future charge on Revenue for the dividends thereon will amount to Rs.30,000 for each half-year. And the Directors point out that the balance of this year's profits to be carried forward is considerably more than sufficient to pay the dividend on these shares for the whole year ending 30th June, 1899. In congratulating them and the shareholders on these results, we may observe that the figures given fully justify the anticipations expressed when the Company was first floated. Excellent management for many years past was, in fact, a guarantee of future success; and that management, we are glad to say, continues.

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain per ton:—

61·50 lbs. Nitrogen.
57·38 „ Potash.
14·92 „ Lime.
13·68 „ Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the 1898-1899 crop of seed from the parent trees of above analysis at Rs.6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the

MANAGER, ARIENKOW ESTATE,
Shencottah.

LETTERS TO THE EDITOR.

"WANTED TO KNOW."

SIR,—With reference to "KARTARY's" statement that he gets

33 bushels parchment,
3 „ tails,
3 „ light,

39

out of 39 "boxes" of cherry, it would be interesting to know what the size of his "box" is. If it is anything like a bushel, what becomes of the "husk" or "sippy"? The "box" must evidently be something nearer two bushels. I measure my cherry and parchment both in the same Imperial bushel measure; the cherry "piled" and the parchment "struck."

Out of 50 bushels cherry I get 24 bushels parchment, $\frac{1}{2}$ bushel tails, and $1\frac{1}{4}$ bushels light. This is copied from an entry in my crop book on the 8th instant.

Does "KARTARY" consider this a bad percentage?

"VERITE."

RINDERPEST.

SIR,—In the *Madras Mail* of the 6th instant, I see that the Ceylon Government Veterinary Surgeon, Mr. G. W. Sturgess, has been inoculating cattle for rinderpest with bile, and states that the operation is simple and effective, and the bile easily procurable. Will you or any of your readers kindly let me know how to procure the bile, and how to perform the operation?

I am surrounded by ryots whose cattle periodically get swept away by rinderpest, and I might, if I could learn how, be the means of saving not only my own, but their cattle for them.

KADUR DISTRICT,
18*th December*, 1898. } D.

CO-OPERATION.

SIR,—A combination of adverse circumstances during the past few years, viz., the rise in exchange, a series of bad seasons, and last year a smart fall in prices, has caused a certain wholesome brisking up among planters. The first signs of this were a distinct drawing in of the horns with regard to unremunerative expenditure, and a determined effort to make such outlay as was necessary as beneficial, and as little wasteful, as possible. A want of knowledge, however, was felt, and a cry went up for the casting of more scientific light on agricultural methods. This resulted in a much wider section manuring in accordance with deductions from soil analyses, and in the Mysore Government appointing an Analytical Chemist for the Province. An article, too, in this paper urged more economical methods, and a systematic attempt being made to establish new markets for our products. And now one of the District Associations has come forward with a proposal for co-operation. This idea is worthy of the serious consideration of all coffee platners, but it is to be regretted, as the *Madras Mail* remarked, that the proposers have not formulated some scheme as a basis on which discussion could take place. As the matter will no doubt be engaging the earnest attention of planters during the next few months, it may not be out of place to briefly review a few points in connection with it.

And let us first consider the area which such a scheme should cover. Should it, as the *Madras Mail* seemed to indicate, undertake the care of the bean from the time it leaves the plantation till it appears, in another form, on the breakfast table? Or should it confine itself to a smaller sphere? The question of capital is here involved. An agency to conduct all the operations between despatch from the estate and delivery to the consumer would necessitate a supply of funds on such a scale as would be exceedingly unlikely to be forthcoming. It would seem desirable, therefore, at first to limit the functions, and with this in view we must first determine in which departments there is most scope for economy. The Shevaroys Association evidently regards *distribution* as the vulnerable point, and proposes that an Agency to promote the sale of coffee, wholesale and retail, should be established. A slight knowledge of the trade in London is sufficient to make manifest that great economies might be effected. Coffee passes through many hands, each of which secures a profit to itself. First, there are the wharfingers' charges, with their huge discounts, which the unfortunate producer does not always participate in; then the selling and buying brokerages, the wholesal buyer's profit to the retail-man, and the latter to th consumer. Beyond these the merchant's commission, whic by no means always represents the whole of his charge Six profits before the article reaches the consumer! N wonder there is little margin left for the producer! Bu the greater evil is that the high rates necessitated to cove these profits checks consumption, and puts coffee beyon the reach of the poor man. Whereas could we do awa with them, we might place it in his hands at a rate at whic he could afford to drink it *ad libitum*, and at the same tim make a better return than we do at present.

The advisability, therefore, of co-operation is apparen but such could only be effected by degrees, and we shoul have to proceed with great caution so as in no way t prejudice the article. There would doubtless be grea difficulty experienced in directing the different qualitie into the corresponding consuming channels, and as ther would be the strongest opposition in Mincing Lane, n help could be looked for from that quarter. A co-operativ agency could give immense stimulus to the sale of coffe by selling the *pure* article, and an equal check to adulter ation. A few simple instructions, or some practical lesson in the making of a good cup of coffee would also tend t increase consumption. In few establishments is a cup f to drink ever served.

Difficulties must of course be expected in connectio with any new scheme, especially with one which, if success ful, might revolutionise a particular trade. The findin of the necessary capital may prove to be one, and anothe will be the fact that many coffee planters are, so to speak, i their Agent's hands, bound to send their produce to ther to be cured and sold. A larger scheme *may* loom som day which would involve the proposed Agency acting a Bankers as well as curers, merchants, and brokers, bu till it does, the unfortunates so bound won't be allowe to co-operate.

For the present we commend the smaller scheme, an wish it every success.

"MOTOR."

MILLIE & REDMOND, late P. THOMPSON & CO., *Ootacamund, Engineers and Contractors.*

TEA UP NORTH.

THE number of tea gardens continues to increase in the Jalpaiguri district, though in the Darjeeling district they have remained stationary for the past three years. The area under both mature and immature plants continues to increase in both districts The gross yield amounted to 35,827,572 lb., as against 34,173,794 lb for the previous year; but owing to the insufficient rainfall at the commeneement of the season the average yield per acre fell from 403 lb. in 1896 to 376 lb. in 1897. The large increase in output has brought down prices to a level which leaves but a small margin for profit. The tea gardens in these districts receive their coolies principally from Nepal and Chota Nagpur, and the number employed is steadily increasing with the extension of cultivation and the opening out of new gardens. The number is always fluctuating, as the coolies come with the commencement of the season and return to their homes after the busy season has passed: those from Chota Nagpur often settle permanently in the Duars.—*Indian Planters' Gazette.*

CHINA'S RIVALRY.

IF those who regard with trepidation the occasional rumours of the revival of the China tea trade will study the past history on this subject, and carefully scan the consular reports, they will not fail to see the fallacy of "conjuring up demons for the pleasure of fighting them." The most up-to-date and reliable information tends to endorse the opinion we have so frequently paraded that, John Chinaman is rapidly substituting more remunerative crops for tea, though so long as a profit can be screwed out of the patches under that cultivation, he is loath to abandon it; but when the case is hopeless, and he sees that no amount of stimulation will retrieve matters, his inborn conservatism yields and attention is directed to other matters. Most of the small tea farmers in the China tea districts are intelligent agriculturists enough, fully capable of judging when soil is worn out; also, though well aware that goed seed is procurable comparatively close at hand, are quite cognisant of the truth of "the effects of putting new wine into old bottles," and this conviction, more than anything else, has led to the steady decadence of the China tea trade.—*Indian Planters' Gazette.*

TEA PROSPECTS IN ASSAM.

THE following telegrams have been received by Mr. J. Buckingham with reference to Tea Prospects in Assam:—

Mr. St. George Showers, Cinnamara:—"Prospects bad, expect finish 20,500 against 19,500 last year."

Mr. C. Forbes, Badlipar:—"This district promises to make eight to ten per cent. increase in crop."

Mr. F. Lloyd, Bindukuri:—"Tezpur gardens, some ahead, some behind, on average district will make original estimate."

Mr. W. H. Lyall, Nowgong:—"Nowgong crop will be about 10 per cent. short, prospects very moderate."

Mr. C. J. Showers, Moriani:—"Crop prospects unsatisfactory, gardens generally going behind."

Mr. J. E. Percy, Golaghat:—"Watson England prospects fairly good, much better than last year."

Mr. W. St. John Mildmay, Luckwah:—"The prospect for this season seems to be fair, but the original estimates are not likely to be realized, though a slight increase on the total output of last season may be confidently looked for, although the aggregate will be considerably under the original estimates."

Mr. John Alston, Talup:—"Your wire 28th, crop in proportion to date somewhat under estimates, and now there is every indication of early close."

Mr. V. R. Butler, Suffry:—"Letter 28th instant, prospects tea fair, outturn prices poor, seed medium, altogether better than last year."

Mr. J. A. H. Jackson, Dibrugarh:—"November promises rather better than 1897, total outturn about equal 1897."

Mr. W. A. Hudson, North Lakhimpur:—"We are shutting up very fast in the district and losing steadily on last year all round."

Mr. E. P. R. Gilman, Kamrup:—"Kamrup slightly ahead, prospects good for final ending."

Mr. E. Scarth, Kolaigaon:—"Original estimate of crop likely to be exceeded, revised estimate of crop shows some increase, owing to later rain the season may be slightly prolonged, crop prospects generally are favourable."

Mr. C. E. Stuart, Bishnath:—"Increase will be eleven thousand maunds, season closing late."

AN OUTLET FOR INDIAN TEA.

THUS the *Planter*:—

The first and foremost desideratum for Indian tea is a *new market.* Where are to be our outlets? There is no reason to believe that the expansion of the English market will keep pace with the increasing production of tea. The imports of tea into England from India alone are close upon some one hundred and fifty-nine millions of pounds this year. If we suppose the same rate of development to continue as has obtained hitherto, who can help seeing that the supply required by the English market will be more than covered by the produce of other countries, such as, for instance, Ceylon alone, and that if India is to enjoy the advantage of even a part of the demand, it will only be on the condition of diminished cost of production. A new market, then, is the thing really wanted in order to save Indian tea from its precarious position. Something might surely be done towards discovering such market at our own doors, viz., in Thibet, to which country great attention is being drawn at present, especially by our leading organ in Bengal, the *Englishman.* The subject is not a new one, nor has much fresh light been cast upon it recently; but old facts have been brought to mind which it is, perhaps, worth while to reiterate. A correspondent, well acquainted with the facts, supplied the following information to a contemporary some few years ago. The Deputy Commissioner of Kamrup is obliged to pay an annual visit to a triangular promontory of British territory in the Bhutan hills, which we have held as a material guarantee since the last Bhutan War, and which is known to us by its Assamese name of Dewangari, but the Bhutias call it Dongsam. Hither the Bhutias come to the number of some thousands in February and March in each year to exchange blankets, lac and wax for the rice, and brass and copper ware of the plains. The Deputy Commissioner noticed their universal practice of drinking large draughts of tea, and on asking for the commodity in its merchantable shape he was shown the veritable *Brick tea* of China, in blocks weighing about 4½lbs. wrapped in paper bearing the Chinese mark. Such a block in Dewangari was worth four rupees, though the tea is of the coarsest description imaginable, and consists, in fact, entirely of prunings, the leaves being large, old and stringy, and intermingled very freely with twigs. An article of equal goodness could be prepared by Assam tea-planters from the refuse of their gardens and offered for sale at Devangari for a few annas a pound.

The making up of refuse tea in this brick shape is just one of those little departures from established custom which it is difficult to get effected, but which, when effected, produces surprising results. When will those interested in the industry wake up to the fact that we have not only this, but many other outlets at our very doors?

WILL YOU HAVE A CUP?

NOVEL WAYS OF PREPARING TEA IN VARIOUS COUNTRIES.

DURING the summer I was travelling far north, where I was the guest of a Swedish lady. She made the most delicious tea, for which she paid something like 10s. a pound. It was carefully strained so that not a bit of leaf came into the cup, and when I told her that we did not strain ours in England, she said she thought it could not be at all nice to find tea-leaves in one's tea.

In Russia I met with tea served in glasses without any milk, but with a slice of lemon instead. It was strained tea, and not strong, and I noticed that it was drunk constantly by the people, with or without anything to eat.

What a number of strange teas a woman of enterprise could inaugurate to amuse her friends? There might be a Uruguayan mode of tea drinking introduced. The tea of that country would be used, prepared like Chinese tea, but with the drinking would come the really entertaining part of the affair. There would be something far removed from the hackneyed in the sight of a group of guests drinking tea through silver tubes, each of which had at the end a ball-like strainer, known as a bomba or bombilla. Little wonder if this tea were pronounced quite a success.

Then there might be a mandarin tea, in which a large artistic cup would be set in a brass or silver holder. In this cup the tea would be placed and covered with boiling water. The process would be continued by the placing of a little saucer inside the cup in an

inverted position, the saucer being of such a size that it just fitted the cup and kept in the steam and flavour of the tea. When the tea was drawn it would be poured from the big cup into dainty little ones no larger than an eggshell.

A Java tea, served in broad, flat cups and flavoured with Batavia arrack, might follow, and might give place next to a Formosa afternoon, in which the tea would be steeped with tea flowers and one or two orange flowers. The result would be a perfume and flavour of the most intense kind. One of the guests would certainly remark that they were not drinking tea so much as wedding bouquets.

A girl who had spent a winter in the West Indies introduced the plan in vogue in Martinique when she reached home again. The tea cup she employed was narrow and rather deep, resembling the old-fashioned lily cup. An aromatic tea was used, and a peculiar liquor made by the monks and by the old French housewives was added. Who will set the fashion for queer teas?—*Daily Mail.*

THE PRESENT POSITION OF THE TEA-PRODUCING INDUSTRY.

WE give somewhat late the following extract from a letter to the *Home and Colonial Mail* by Mr. John McEwan :—

The market prices of tea are undoubtedly lower than ever, but that was a result clearly foreseen by many, and only in keeping with the experience of the last twenty or thirty years. It was anticipated and provided for in most cases by extensions which were designed to increase the yield, and so to maintain the net revenue.

History has repeated itself in tea, as in other matters, and every general decline in price has been followed by an increased consumption. During 1898 the increased consumption of Indian tea at home and abroad has been on a larger scale than ever before in the history of the industry, and there is no doubt now that within the year much more will be consumed than has been produced. There is little need to agitate for new markets. The largest and best of those have opened up themselves through the ordinary channels of trade, and every possible outlet in new directions is closely watched by practical distributers eager to widen their connections. It is merely a question of price, and lower values have done more in the last twelve months to increase the sale than the efforts of special missionaries in as many years. The remarkable point about the increase is that it has taken place chiefly in quarters where no special efforts have been made—except by ordinary traders—to push British-grown teas. This fact may suggest to the Associations in Calcutta and Colombo the advisability of withdrawing their commissioners and devoting their attention and funds in other directions. If they still consider it necessary to appeal for voluntary, or to collect forced levies, let them apply the money raised to some scheme having in view the improvement of quality, and the reduction of the quantity of inferior tea.

The position is gradually modifying, as it has done before. Unprofitable estates, or sections of such, are being abandoned; expenditure is being more closely watched; greater efforts are being made to produce tea of good quality, with the result that there is some reduction in the quantity made. The abnormal weather conditions referred to above have doubtless restricted yields, and there is much reason to be thankful. One of the most serious risks ahead is that of a "bumper crop" coming simultaneously in India and Ceylon before the volume of consumption has advanced sufficiently to absorb easily the yield.

Some cranks may take the advice given them by one writer and destroy good sound tea by making it into Oolong or green, and they will be wiser after the event, but anyone with an expert knowledge of tea who expects Indian unfermented teas to drive out Japans is only fit to herd with those who for the last ten years have been shouting the parrot-cry, "Capture the American market."

In conclusion, let me repeat the advice to investors and producers, not to allow themselves to be influenced by anonymous scribblers, but rather to consult experienced tea or share brokers, who have an expert knowledge of the producing and distributing conditions of the great tea industry.

EXPORTS OF INDIAN TEA FROM CALCUTTA.

THE General Committee of the Indian Tea Association have issued their Monthly Return of Sailings and Daily Customs Entries of Tea from Calcutta, and also a Return of Export of Ceylon Tea for fou years up to the 22nd November, 1898, as follows :—

	1898. lbs.	1897. lbs.	1896. lbs.
Sailings to Great Britain in November	21,791,996	20,698,850	19,220,18

AN AVERAGE OF A SHILLING.

A PROMISING OUTLOOK FOR TRAVANCORE.

IT is so unusual for an estate's tea to average a shilling per lb nowadays, that when this does occur, it may be safely assumed tha a very good article has been produced. Such a satisfactory pric has recently been obtained in Calcutta for Munaar teas, as the resu of a series of experiments by a well-known Darjeeling tea expert— Mr. R. R. Landale—who has of late been more intimately connecte with the Doolaria estate in the Kanandevan District, Travancor

where Messrs. Finlay, Muir & Co. are the owners of some 10,000 acres of land. Mr. Landale arrived at Colombo from Tuticorin on Friday for the purpose of seeing some of Messrs. Finlay, Muir & Co's up-country estates, but a Director's request that he should forthwith put in an appearance at Glasgow has considerably altered his arrangements, and his up-country visit will only extend to Thursday, when he leaves for Scotland. Mr. Landale has had 24 years' experience as a tea expert in India, a considerable portion of that period having been spent on a Darjeeling estate—which also belongs to Messrs. Finlay, Muir & Co.—while more lately he has put in his time at the Kanandevan Estates, Travancore.

In answer to questions by one of our reporters, he said that the Kanandevan Tea estates comprised about 10,000 acres. They were all comparatively young estates, and only for a short time had tea been made there. The elevation of the gardens varied from 4,000 to 6,000 feet, the temperature consequently being low. Tea was made in the usual way until a few weeks ago, the average realised for the last consignment of tea being 8¼*d.* Mr. Landale did not feel satisfied with this figure, and had the impression that a great advance in quality of tea might be brought about by an improvement in the method of manufacture. He immediately commenced a series of experiments at the Munaar Factory, which is fitted throughout with electrical appliances, with tippings from a heavy prune. First of all he tried the Darjeeling mode of manufacture, but ascertained that that was not suited to the Munaar teas, and so turned his attention in other directions. The teas resulting from each experiments were submitted for valuation, according to which Mr. Landale gauged the succeeding experiment. At length, after surmounting considerable difficulties that we have not the space to detail here, he succeeded in producing a tea from various high class jats under the name of Munaar, which both at Colombo and Calcutta was valued at a shilling per pound.

Having got thus far the *Times* representative asked the perhaps unnecessary question whether Mr. Landale attributed the high price obtained solely to the process of manufacture, to which he unhesitatingly replied in the affirmative, and so he saw no reason with the continuance of that mode of manufacture why the teas should not always average 11*d.* or 1*s.*

"That will have a great influence on the tea market?" queried the interviewer.

"Yes," said Mr. Landale, "it will. It will also mean a great thing for Messrs. Finlay, Muir & Co., who have sunk a lot of money in these estates which comprise the whole of the high range. An average of 8*d.* might give them a profit, but the difference between 8*d.* and 11*d.* or 1*s.* means the difference between a good speculation and an indifferent one."

Questioned as to probable yields, soil, seed, and so on, Mr. Landale said he had never seen such luxuriant and healthy tea without blight in the second year, and for that circumstance he attributed the combination of a friable soil and suitable climate. The seed was all high-class, and came from the best gardens in Ceylon and India. The approximate yield was from 500 to 600 lbs. per acre, and when the whole 10,000 acres were in full bearing, in three or four years' time he estimated that they would be able to put at least 5,000,000 pounds of tea per annum into the market, and, if such good tea could be made after heavy pruning, there was every probability when they got two or three years from the prunings that still better tea would be produced.

Asked how he thought the Munaar teas compared with the best Ceylon growths, Mr. Landale said he had tasted a hundred samples of Ceylon tea that morning, and the Munaar tea, in his opinion, compared very favourably indeed, and could enter into competition with the products of the best Ceylon gardens and good Darjeeling growths.

Upon the matter of transport being broached, Mr. Landale stated that the Kanandevan estates laboured under considerable difficulties in that respect. Between the estates and the coast the ghauts rose to a height of 8,000 feet, with a sudden big drop, and then there was level ground to the sea. Bullock waggons were the means of transport adopted where possible. Cochin had not been used so far, but there was a talked-of single tram line from the estates to Ammanayakanur, at which point the South Indian Railway could be utilised. A tram line would be of immense benefit with the estates, Mr. Landale said as the interview concluded, and in addition to the other evident advantages in the matter of transport, the hundreds of bullock carts used to convey rice for the coolies would be dispensed with, and much quicker means of carriage obtained.

CARDAMOMS.

A WRITER in the *Planter* says:—

This is a profitable planting product cultivated where conditions are favourable. The spice commands a good price, and is always in demand. A large degree of moisture is necessary, and, hence, only Malabar and Coorg grow it to perfection. In the latter province, till a recent date, it was a Government monopoly, the price paid the producer by the State being sometimes as low as 25 per cent. of the selling price of the commodity, and the regulations imposed on the landholder not different from those prevailing in Java in reference to coffee at the present day. The Coorg now sells his cardamoms in the open market and often makes a very good thing of it. There is a tradition, though how it originated and why it continues to be acted upon is unknown, to the effect that the plant is spontaneously produced by the concussion occasioned by the falling to the ground of a large tree felled over it. Accordingly, on securing the grant of a suitable bit of forest, the male members of a Coorg family proceed to the spot and select a patriarchal giant, which they proceed to cut down, after clearing the surrounding scrub and brushwood. The felling must be completed before sunset on the day it is started, or the garden will, according to native ideas, prove a failure. Of course the spontaneous theory is fallacious and the plant in the locality is indigenous, with its haulms underground.

Cardamoms thrive in a light soil, a sandy loam devoid of clay, but if it should prove too stiff, river sand and paddy husk mixed will confer the friability desired. Shade may be dispensed with at high elevations, but in the low country and in a lesser degree in altitudes ranging from 1,800 to 3,500 feet, it should be retained. If the shade is too dense, the stalks from the rhizomes will be few, but if sunlight be moderately admitted, they will increase amazingly to the number of 70. If exposed too freely to its influence on the other hand, the plant will languish. Each stalk produces a peduncle from 1½ to 2½ feet in length, on which capsules appear, ranged alternately on the shaft at a distantce of 2½ or 3 inches from each other. Appearances, however, cannot be relied upon in estimating the crop, for the plant has an excess of moisture, and the fruit will dry down to a fifth of what it weighs in the green state.

Where the cardamom is spontaneous, of course the garden will be irregular, but if laid out, the plants should stand at a distance of from 8 to 12 feet apart, in holes a foot deep and 20 inches square, and so planted that the soil around them may be from 4 to 6 inches above the surrounding soil to prevent injury from wash.

Insects are very liable to attack the rhizome in its tender state. They should be picked off early in the morning, and kept away by sprinkling wood-ash, lime and soot, or sulphur on the surface.

Young bulbs from a year to two years' old are the best to use, and should not have the tops trimmed. They should be just covered with soil, and a little shade around them when sprouting, for a week or so, is desirable. It is a mistake to bury them too deep, and equally so to change them every fifth or sixth year, on the assumption that they will not fruit freely, unless this is done. But after use for three years, the bulb should be pruned, that is, all the decayed parts cut out, and if those thus treated are replaced in fresh soil and manure mixed with it, new bulbs will take their place.

Plants raised from seed are the best with which to stock a plantation, but germination is exceedingly slow, and, therefore, risky, taking from three to five months, and the seedlings will be fit to put out in a year. In its natural climate and in good soil, the cardamom fruits in the second year, and bears a full crop in the fourth. Each plant will harvest a quarter of a pound; and the 60 to an acre, which is the number at the distance apart above prescribed, will return 15 pounds of dry spice per acre. The stalks, as soon as they have matured their fruit, die down and are replaced by fresh ones, and this goes on, year after year, for an indefinite period.

Crop is ready for gathering when it turns yellow, and young children with long finger nails are the best to employ for the purpose, avoiding the use of the scissors. Under-ripe capsules should be separated from the over-ripe, or the latter will discolour the former when drying, and all should be washed before drying. The unripe will be all the better for a momentary immersion in boiling water, and acquire the straw colour so much desired in the capsules. No delay should occur in drying cardamoms, if the weather should be unfavourable for doing it in the open air. A room with a fire place should be fitted up for the purpose. Cardamoms undergo a process of bleaching for market, which is tedious and costly. It consists in exposing the capsules to the action of sulphur fumes, which has the

effect of transferring their dingy grey to a delicate pale straw colour.

In England the price of the spice varies between 8*d.* and 5*s.* a pound, and Ceylon is the principal source of supply at present, besides Malabar and Coorg.

CEYLON TEA IN THE STATES AND CANADA.

SINCE his return to Colombo, we have had the opportunity, says the *Times of Ceylon*, of having a very interesting thumb-nail interview with Mr. J. A. Henderson, of the firm of Messrs. Tarrant, Henderson & Co., in the course of which we directed our enquiries chiefly to matters connected with the development of our tea trade with America, a subject in which Mr. Henderson is specially interested, and, in fact, so much interested that he went the length of visiting the country, thus changing to a pretty considerable extent what was originally only intended to be a pleasure holiday away from Ceylon. Mr. Henderson, after a short time in England, travelled first to Canada and practically began his tea trade inquiries at Montreal. There Ceylon tea did not seem to have caught on very greatly—a fact which he attributes largely to the national characteristics of the people residing in that part of the Dominion, who, as our readers know, are mostly French. Still, our tea was decidedly doing well; and the trade showed signs of marked improvement compared with when he was there four years ago. From Montreal he journeyed to Toronto, where he found our staple being absorbed in surprisingly large quantities. Remembering the trade of four years ago, he was astounded at the development that had taken place; and in this connection he speaks in terms of the very highest eulogy of the work which our Commissioner (Mr. Mackenzie) and Mr. Blechynden have been carrying out. He says in Toronto they have thoroughly inculcated a knowledge and a liking for Ceylon tea; and our tea there is now certainly booming.

A GOOD WORD FOR MR. LARKIN.

In this connection Mr. Henderson recognised the good work which had been carried on by Mr. Larkin, of whom he speaks in the very highest terms, his remarks about him being that he is a thoroughly up-to-date, wide-awake Canadian, full of energy and go, deeply impressed with the superiority of Ceylon tea, and determined to push the tea wherever he can in the Dominion and even outside it, for Mr. Henderson told our reporter that he understood that Mr. Larkin had a tea house as far south as Philadelphia, which, just at the time Mr. Henderson was in Canada, was not so successful as Mr. Larkin had hoped it would be, but which Mr. Henderson advised him to hold on to as it was pretty certain to develop into something good later. Mr. Henderson adds that Mr. Larkin's business is one entirely confined to tea. It is no grocer's shop, where sugar and treacle are vended as well as the cup that cheers. It is a house of the Cooper, Cooper kind, dealing in nothing but tea—and that Ceylon tea—while his machinery is all of the very latest type.

A GRIEVANCE THAT WAS IMAGINARY.

In Toronto, Mr. Henderson, in talking with some of the trade on the subject of Ceylon tea in Canada, had the remark made to him that they felt that they were handicapped by the fact that certain firms were to an extent subsidised by the Ceylon-Indian Commissioners, and they did not enjoy similar advantages. He thought that nothing more had been done by Messrs. Mackenzie and Blechynden than they had done with every other dealer who is agreeable to spend money in advertising. Ceylon tea, namely, they had assisted out of their funds with sums to enable such dealers to spend in advertising, and Mr. Henderson advised his agents to make application to them for similar aid. There is no doubt the firm has since received it, and so will not feel the result of the handicap any longer. From Toronto Mr. Henderson went to London (Ontario) and thence to Niagara, where he had a good time inspecting the Falls and other places of interest in the neighbourhood, and after a short stay there he returned to New York, where, he says, he found Ceylon tea was making very steady headway. Messrs A. E. Nicholson & Co. are selling a much larger quantity than they formerly disposed of, while a capital business is being done by Messrs. A. R. Robertson & Co., both of whom represent Ceylon houses.

THE TEN-CENTS DUTY.

Speaking of his trip to America as a whole, Mr. Henderson said: "Of course we are heavily handicapped by the fact that there is a 10-cents duty on tea and no duty on coffee. This naturally prejudices the sale of our tea, or, for the matter of that, any tea that is imported into the country; and we ought to make it our business to get tea put on the same basis as coffee. America is essentially a coff drinking country, and if that product is admitted duty free while t duty is maintained on tea it is likely to continue so. Our aim mu be to have the two beverages treated alike. My experience of t whole trip, however, has been that I found Ceylon tea was very mu more on the go in America now than it was four years ago, a that fact, I think, is to be entirely attributed to the excellent wo which the Ceylon and Indian Commissioners have carried ou When I was there, four years ago, Ceylon tea was practically u known, but now it is known and largely used and is a fashionab beverage." Prior to his visit to America Mr. Henderson went a trip

THROUGH HOLLAND,

just before the festivities took place in connection with the accessi of the young Queen Wilhelmina; and he made inquiries as to o tea at Amsterdam and Rotterdam, but found that the teas prin pally used there came from Java and China—the Dutchmen natural preferring their own countrymen's product as far as the Java t was concerned. There was very little Ceylon tea being used ther but still it was apparently making slight headway. Mr. Henders also did

A TOUR OF GERMANY,

going first to Bremen and to Hamburg, where he made inquiries his firm's agents, which showed that our supplies to the Fatherla were increasing considerably. He journeyed to Berlin, and fro Berlin on a pleasure trip, which he then indulged in, to Dresde and down the Rhine. He believed tea was being very freely drun though, when asked if, in visiting any Thee Haus and asking for t he was supplied with the Ceylon article without special request, answered laughingly, "No, like most Englishmen I have a certa awesome feeling in regard to continental tea houses." Howev the result of his trip through Germany showed what a very gre deal could be done in the way of advertising Ceylon tea in t country; and he hopes that this will be done.

CEYLON MEN AT HOME.

Mr. Henderson had not much to tell in regard to his experienc in England, where he was holidaying for the most part, but among other Ceylon folk that he met were Mr. Donald Noble, who is n settled down in London, and who, he said, was looking very fi Col. Sadler of the Army Ordnance Staff, who is now stationed Woolwich, being one of the officers in command of the Arsena Mr. G. J. Jameson, whom he met in the city, apparently in the be of health; Mr. Fitzclarence, who was formerly a proprietary plant in Ceylon, and who said that he was longing to pay a return trip the island; Mr. Forbes Laurie; Mr. Geo. Hedges, who mention incidentally that he was coming back to Ceylon very shortly for brief visit; and Mr. R. A. Bosanquet, who had just arrived hon when Mr. Henderson met him in London.

COLOMBO MARKET *vs.* THE LONDON MARKET.

In leaving Mr. Henderson, our reporter asked him if he visited t London tea market, and, on learning that he did, put a question to what Mr. Henderson thought of the value of that market as com pared with Colombo. He replied:—

"My opinion may appear to be more or less biassed, but I neve theless think the Colombo market is very much better than th London market. In London, the trade has now practically got in the hands of a few big buyers like Lipton, Brooke Bond & Co., th Mazawatte Company, the Home and Colonial Stores and the Whol sale Co-operative, who have knocked a lot of the smaller men ou The consequence is competition has been reduced, whereas, in th Colombo market, as far as buyers are concerned, the number h increased far more rapidly than has the quantity of tea locally offered

CHINA *vs.* CEYLON AND INDIA TEA.

THE *American Grocer* publishes the following very interestin paper:—

There is no small controversy over the relative merits of Ceylo India, China, and Japan teas. The advocates of each seeming forget that there are good and bad teas of all growths; that ind vidual tastes differ; that the American people are not particularl fond of tea as a beverage, and that not one in a hundred consume brew tea in a right manner or use it without "trimmings."

One cannot fail to admire the pertinacity and skill which ha marked the efforts of those interested in making a demand fo Ceylon and India teas, and whose work has been so effective that has forced the tea industry of Japan to enter upon a campaign

Quotations will be obtained and orders booked for any Manures not kept in stock. F.r.m.

advertising in the interest of Japan and Formosa teas as an offset to the publicity given to Ceylon and India leaf.

Recently a correspondent of the New York *Journal of Commerce* wrote as follows:

So much appears in print now advertising India and Ceylon teas, and claiming greater purity for them than for China teas, that it is only fair to the public that the true situation should be told them as it exists at the present time.

Some of the first Ceylon and India teas exported were very fine, but the quality of the present exports from those countries is far below what it was at first, while the quality of the China tea has for the past year or two steadily improved. This country is a large consumer of China tea, and the present laws of our Government tend to prevent the import of poor teas; but whatever causes have brought about the present situation, the actual facts regarding the relative qualities of teas from those countries should be made known to the public.

Recently, in making an extensive drawing of teas from Ceylon and India, averaging about 25 cents per pound duty paid, in price, and a like drawing of Formosa Oolongs and Congous from China, the fact was most apparent that the China teas were decidedly clearer in water and without the muddy liquor of the India and Ceylons, and were also of decidedly better flavour and quality.

Advertising is very well in its way, but the facts which I present cannot be controverted; and in my judgment the consumers of the United States can in the future look for better and purer teas from China than from India.

E. A. Willard.

This called forth from a prominent jobber of tea the following letter to the same journal:—

During the last few days we have noticed in your valuable paper some interesting letters headed "China *vs.* Ceylon Tea." It is seldom we take the trouble to express in print an opinion on such matters, but in this instance we feel compelled to do so, because some of the statements made in recently published articles are not in accordance with facts.

Although we continue to do a large business in China tea, we are forced to carry a large stock of both India and Ceylon tea, because most of our customers will have them, and the demand is largely on the increase, especially among those buyers who appreciate quality and will pay a fair price.

It has not been our experience that Ceylon teas are deteriorating in quality, but, on the contrary, they have never been better than at the present time.

It is not our business to do "missionary work," but to meet the demands of the trade as we find them. The rich drinking qualities of Ceylons are certainly appreciated by lovers of good tea, and will eventually materially increase the consumption to the detriment of China teas.

Thomas Reid,
Vice-President Eppens, Smith & Wiemann Co.

We have received the following letter on this subject from Messrs. Thomas Martindale & Co., Philadelphia, the blenders of "Caricol" tea, who formerly did not look with favour upon Ceylon or India tea, while now they are the most enthusiastic of advocates:—

Philadelphia, *Nov.* 9, 1898.

Editor, *American Grocer.*

I have read with interest a letter upon "China *vs.* Ceylon Teas" in the N. Y. Journal of Commerce from a tea broker relative to the comparative merits of China and Ceylon and India tea. Only a few years since, I was a bellever in the theory that Ceylon and Assam teas were too strong, too rich in tannin—"too rich for onr blood," in fact—in this dry electrical climate of ours; but I couldwell understand the high favour which these teas met with in England, because the wet, damp climate, with its raw benumbing cold in the winter months (that characterizes the major portion of the weather in England, Ireland, Scotland, and Wales) demands just such a nourishing—such a "grateful and comforting" drink as can alone be obtained from a cup of rich, full-bodied and fragrant Ceylon or Assam tea.

In fact in my various visits to the mother country, I was so captivated with their "two-shilling" teas, for instance, that I would bring some home with me for my own table; but I fancied that they did not taste nearly so well here as they did in England, which was probably due to the difference in climatic conditions; but the taste for them grew upon me, and I finally began to experiment with them in our various blends which we sell so largely throughout the United States—at first gingerly and mincingly—fearful of making m takes; but as popular approval, in the shape of increased sales a enthusiastic commendations, followed upon each increase of t proportions in which we used them in the "blends," we have fina reached a point that we never dreamed of, and that is to say th very nearly half of the stocks of black teas which we now carry our warehouses are of Ceylon or Assam growth. Nor can this called a matter of partiality either, because we find that their u now in our blends is imperative—we could not well discontin them if we would.

If any dealer doubts the value of our experience in this respect, him start, say with an addition to any of his black or mixed teas but 10 per cent. of good Ceylon or Assam tea, then let him bide t result, and when popular approval does surely show itself, let h then gradually increase this proportion until he has, say, a third good Ceylon, a sixth of Congou, and the balance of Foochow Oolon and let him note the pleased looks of his customers as they co back for more of "that very same tea" which they got before—" was just splendid."

We candidly admit that the mixture of these teas in our "Carico blend has more than trebled its sales, and that not alone in territo like the coal regions of Pennsylvania (where a heavy-bodied tea always in vogue), but in all parts of the country, in the Far W where pan-fired and basket-fired Japans are the rage, and in t South where Chinese greens are used largely, as well as in N England where the people are partial to straight Formosa Oolong, that I am sure the time has come when the Chinese and Japan tea-growers may well look with apprehension upon their vanishi trade, not alone in England, but in America as well.

Thomas Martindale

The facts are that the imports of India and Ceylon tea into t United States, both direct and indirect, show a notable increase fr year to year. Nearly every retailer is forced to keep Ceylon a India tea in stock, while every blender recognites their intrin merit. The people have been slow to acquire the correct method brewing, lacking faith in the statement that one-third or less Ceylon or India tea was required than of China or Japan sorts make a satisfactory infusion, and that the tea should be steeped o three to five minutes. Failure to observe the proper directio naturally resulted in a heavy-bodied tea of sweetish flavour, entir foreign to that which American tea-drinkers for a century have be accustomed, and, therefore, they have been slow to change fr China or Japan tea to Ceylon or India. The trade, by blending, h done much to overcome this difficulty, and paved the way for a larg use of straight Ceylon and India tea, the finer grades of which a light-bodied and of more delicate flavour than medium and low grad

Lovers of the fragrant leaf, particularly such as have a ke unpreciation of flavour, will always be wedded to the best teas of countries. Fortunately, among 75,000,000 people, there is su a variety of taste and desire, that there is a big enough market f all sorts of tea. The signs of the time point to an enlarging dema for fine tea, and greater attention on the part of consumers to flavo and body and to the use of tea without milk or sugar. Ceylon a India teas show the same wide range of quality as China and Jap while growers in all countries are more than ever studying t world's markets and curing their tea in a way calculated to m perfectly meet their requirements.

DISTRICT ASSOCIATIONS.

WYNAAD.

Proceedings of a General Meeting held at Meppadi on 14 December, 1898.

Present:—Messrs. J. W. Hockin (*Chairman*), B. M. Beb E. H. F. Day, R. Lamb, C. C. Lance, D. Mackenzie, W. MacKinla S. Robinson, G. Romilly, and E. DeFonblanque (*Hony. Secy.*)

Proceedings of last Meeting.—The Proceedings of the last meeti were taken as read.

Roads.—Read letter from the District Engineer on the subject the Palipoya bridge. *Recorded with satisfaction.*

Plague.—Proposed by Mr. D. Mackenzie, *seconded* by Mr. G. Romill that the Collector of Malabar be asked whether special arrangemen might not be made to provide a sweeper for Meppadi Bazaar so lo as there is danger of plague. *Carried.*

BREECHES TRADE.

Breeches-making is a *specialité* with us. **Mr. Smith**, the proprietor, deals with every pair, and we warrant turning them out to satisfaction as regards fit, style and workmanship.

THE INDIA TRADING COMPANY, Limited,

AGENTS FOR **MADRAS,**

Messrs. HIERON ROLFE & CO., LONDON.

ORDERS BOOKED FOR

BEGG'S PATENT TEA ROLLING MACHINE £95.

PACKING AND SHIPPING £3-10.

THIS machine has been in use for some years past on private estates in Assam, and the excellence of the tea manufactured thereby is proved by the good prices obtained, and the reports characterise the teas as being "good *tippy* teas, with strong pungent liquor, and well-twisted leaf."

The roller adapts itself to any class of leaf, and can be used, if desired, as an open top machine, or pressure can be applied as lightly or heavily as necessity may arise by means of a simple mechanical arrangement. The twist in the leaf is obtained to a degree of nicety without balling, no breakage occurs, and is kept cool throughout. The tips are not blackened by the oxidation of the juice from the leaf.

The low price of the machine will allow planters to obtain an excellent leaf roller at a very moderate figure, and thus be enabled to supplement their rolling plant, which in so many cases is insufficient.

The machine is very easily driven, absorbing about 1½ h.p. only when fully charged. The mechanism is exceedingly simple, and nothing can get out of order. All parts are made of the best material, and good workmanship guaranteed. It will take 300 lbs. of withered leaf at a time, and is easily and rapidly filled and emptied.

TILESTONITE.

A new covering for corrugated iron roofs and walls.
Invaluable as a Heat-, Fire-, and Water-proof covering for Withering-Houses, Fermenting Rooms, Offices, &c.
Makes a clean, fireproof floor for an upper sorting or withering department.

Further Particulars on application to the India Trading Co., Ld., Madras.

Sale of Estates for Arrears of Revenue.—*Read* letter from the Collector of Malabar stating that instructions had been given that all notices of estates for sale for arrears of revenue should be printed in English as well as in Malayalam. *Recorded.*

Non-service of Warrants.—*Read* letter from Mr. H. Waddington. *Recorded.*

Petty Cash.—*Read* letter from Deputy Tahsildar. *Recorded.*

Pudu Padi Hotel.—The new rules were submitted to the meeting and passed.

Exchange.—*Read* letter from Mr. Gompertz on the question of Exchange. It was decided that no action should be taken in the matter.

A vote of thanks to the Chair closed the Proceedings.

Indian. The continuance of heavy sales has proved a severe stra upon the market and resulted in less general competition with weak prices.

Ceylon. The small auction passed with good spirit for Teas of t lower grade, while the recent reduction in price of Teas over 9d. attracte buyers and caused some increase in competition.

Average for the week 8·20d., against 8·65d. same period 1897.

Ceylon Tea sold on Garden Account 1st Jan. to date 1898, 1,028,366 pkg av. 7·75d. 1897, 995,696 pkgs., av. 7·78d.

COCOA.

No public sales were held yesterday, the market being very quiet, and privately only a small business effected.

We quote—Trinidad, middling to fine red 75s to 78s 0d, gray and mixed red 75s to 76s; Guayaquil, Caraquez 72s 0d to 73s 0d, Arriba 76s to 78s; Ceylon, middling to fine 73s to 79s. Stock 102,200 bags, against 95,143 bags last year.

SULPHATE OF QUININE quiet; a small business has been done at 10d per ounce for spot.

CINNAMON.

At the last auctions of the year, held on the 28th inst., the large suppl of 4,812 packages was offered, divided as follows :—3,931 bales, 859 bag 8 boxes, 14 parcels. These met with a quiet demand, the sale openi fairly steadily for seconds, thirds and fourths, firsts not being well co peted for. As the sale proceeded, the demand slackened, but importe being anxious to meet the market, a good proportion of the supply (2,6 bales and 850 bags) was disposed of. Prices throughout were irregul and generally lower. We quote a decline of ½d to 1½d per lb. on firsts, to 1d on seconds, 1d on thirds, and ½d per lb. on fourths.
